ABSTRACT
In this paper we applied the tanh method for analytic study of the nonlinear equations of partial differential equations(PDEs). The proposed method gives more general exact traveling wave solutions without much extra effort. Three applications from literature of nonlinear equation of PDEs were solved by the method. The calculations demonstrate the effectiveness and convenience of the method for nonlinear sub system of PDEs.

Keywords
Tanh method, Hirota equations, exact solutions.

1. INTRODUCTION
The nonlinear partial differential equations (NPDEs) are widely used to describe many important phenomena and dynamic processes in physics, chemistry, biology, fluid dynamics, plasma, optical fibers and other areas of engineering. Many efforts have been made to study NPDEs. One of the most exciting advances of nonlinear science and theoretical physics has been a development of methods that look for exact solutions for nonlinear evolution equations. The availability of symbolic computations such as Mathematica program has popularized direct seeking for exact solutions of nonlinear equations. Therefore, exact solution methods of nonlinear evolution equations have become more and more important resulting in methods like the tanh method [1–3], extended tanh function method [4], the modified extended tanh function method [5], the generalized hyperbolic function [6]. Most of exact solutions have been obtained by these methods, including the solitary wave solutions, shock wave solutions, periodic wave solutions, and the like.

In this paper, we propose tanh–coth and tan–cot, methods to obtain an exact single-soliton and travelling wave solutions of the Hirota equation with a source. In order to illustrate the effectiveness and convenience of the method, we consider the Hirota equation in the form [12,13]. The standard tanh method and the proposed modifications all depend on the balance method, where the linear terms of highest order are balanced with the highest order nonlinear terms of the reduced equation. In this paper, we use the tanh method to find the exact solutions of the following nonlinear PDEs: the nonlinear Hirota equation in the form [12,13], the standard tanh method provides an exact single-soliton solution of the reduced Hirota equation. This will be useful in numerical studies.

2. OUTLINE OF THE TANH & TAN METHODS
The tanh method will be introduced as presented by Malfliet [8] and by Wazwaz [9–11]. The tanh method is based on a priori assumption that the traveling wave solutions can be expressed in terms of the tanh function to solve the coupled KdV equations. The tanh method is developed by Malfliet [8]. The method is applied to find an exact solution of a nonlinear ordinary differential equation. Consider the following PDE.

Consider the nonlinear partial differential equation in the form

\[ F(u, u_t, u_x, u_{xx}, u_{xxx}, \ldots) = 0 \]

Where \( u(x,t) \) is the solution of nonlinear partial differential equation Eq. (1). We use the transformations, \( \equiv \kappa(x-\lambda t) \), to transform \( u(x, t) \) to \( U(\xi) \) give:

\[
\frac{\partial}{\partial t} = -\kappa \lambda \frac{\partial}{\partial \xi} \equiv \kappa \lambda \frac{\partial}{\partial \xi} \equiv \kappa^2 \frac{d^2}{d\xi^2} \equiv \kappa^3 \frac{d^3}{d\xi^3} \text{ and so on,}
\]

then Eq.(1) becomes an ordinary differential equation

\[
N(U, \kappa U', \kappa^2 U'', \kappa^3 U''', \ldots) = 0, (2)
\]

With \( N \) being another polynomial form of its argument, which will be called the reduced ordinary differential equation of Eq. (2). Integrating Eq.(2) as long as all terms contain derivatives, the integration constants are considered to be zeros in view of the localized solutions. However, the nonzero constants can be used and handled as well [11]. Now finding the traveling wave solutions to Eq. (1) is equivalent to obtaining the solution to the reduced ordinary differential equation (2).

For the tanh method, we introduce the new independent variable [13]

\[ Y(x,t) = \tanh(\xi) \text{ or } Y(x,t) = \coth(\xi), \]

that leads to a change in the derivatives:

\[
\frac{d}{d\xi} = (1 - Y^2) \frac{d}{d\tau},
\]

\[
\frac{d^2}{d\xi^2} = (1 - Y^2) \left[-2Y \frac{d}{d\tau} + (1 - Y^2) \frac{d^2}{d\tau^2}\right],
\]

\[
\frac{d^3}{d\xi^3} = (1 - Y^2) \left[2(3Y^2 - 1) \frac{d}{d\tau} - 6Y(1 - Y^2) \frac{d^2}{d\tau^2} + (1 - Y^2)^2 \frac{d^3}{d\tau^3}\right].
\]

Where the other derivatives can be derived in a similar way. We use new independent variables

\[ Y(x,t) = \tan(\xi), \text{ or } Y(x,t) = \cot(\xi), \]

that leads to the change of derivatives

\[
\frac{d}{d\xi} = (1 + Y^2) \frac{d}{d\gamma},
\]

\[
\frac{d^2}{d\xi^2} = (1 + Y^2) \left[-2Y \frac{d}{d\gamma} + (1 + Y^2) \frac{d^2}{d\gamma^2}\right],
\]

\[
\frac{d^3}{d\xi^3} = (1 + Y^2) \left[2(3Y^2 - 1) \frac{d}{d\gamma} - 6Y(1 + Y^2) \frac{d^2}{d\gamma^2} + (1 + Y^2)^2 \frac{d^3}{d\gamma^3}\right].
\]

The next crucial step is that the solution we are looking for is expressed in the form

\[ u(x,t) = \theta(\xi) = \sum_{i=1}^m a_i Y^i = a_0 + \ldots + a_m Y^m, \]

where the parameter \( m \) can be found by balancing the highest order linear term with the nonlinear terms in Eq. (2), and \( k, \lambda, a_0, a_1, \ldots, a_m \) are to be determined. Substituting (5) into (2) will yield a set of algebraic equations \( k, \lambda, a_0, a_1, \ldots, a_m \) because all coefficients of \( Y^i \) have to vanish. From these relations \( k, \lambda, a_0, a_1, \ldots, a_m \) can be obtained. Having determined these parameters, knowing that \( m \) is a positive integer in most cases, and using (5) we obtain an analytic solution \( u(x,t) \) in
a closed form [11]. The tanh method seems to be a powerful tool in dealing with coupled nonlinear physical models. For a coupled system of nonlinear differential equations with two unknowns:

\[ F_1(u, v, u_x, v_x, u_{xx}, v_{xx}, \ldots) = 0 \]

\[ F_2(u, v, u_x, v_x, u_{xx}, v_{xx}, \ldots) = 0 \]  

(8)

As for the traveling wave solutions to (6) concerned, we have to solve its corresponding reduced ordinary differential equations

\[ N_1(u, v, u', v', u'', v'', \ldots) = 0, \]

\[ N_2(u, v, u', v', u'', v'', \ldots) = 0. \]  

(9)

In most cases, the exact solvability of (7) depends on a delicate explicit assumption between the two unknowns or their derivatives, for more details see [12].

3. NUMERICAL EXAMPLES

The tanh method is generalized on three examples including Hirota equations.

Example 1.

Let us consider the Hirota equation (1) in the form [12]

\[ i u_t + u_{xx} + 2|u|^2 u + i \alpha u_{xxxx} + 6 \alpha |u|^4 u_x = 0. \]  

(10)

Which is the standard Schrödinger equation in the case when \( \alpha = 0 \), is a famous mathematical and physical equation (Example 3). Where the cubic term in (10) describes the nonlinear-self interaction in the high frequency subsystem, such a term corresponds to a self-focusing effect in plasma physics. The coefficient \( \alpha \) is a real constant that can be a positive or negative number.

\[ u(x, t) = u_1(x, t) + i u_2(x, t), \]  

(11)

Using the traveling wave transformations:

\[ u_1(x, t) = U(\xi) = \sum_{n=1}^{3} a_n Y^n, \]

\[ u_2(x, t) = V(\xi) = \sum_{n=1}^{3} b_n Y^n, \xi = \kappa(x - \lambda t), \]  

(12)

The nonlinear system of partial differential equations (10) is carried to a system of ordinary differential equations.

\[ \kappa \frac{dV}{d\xi} + 2(V^2 + U)U + \kappa^2 \frac{d^2U}{d\xi^2} + \alpha \kappa \frac{dV}{d\xi} - 6 \alpha (V^2 + U) \frac{dV}{d\xi} = 0, \]

\[ \kappa \frac{dV}{d\xi} - 2(V^2 + U)V - \kappa^2 \frac{d^2V}{d\xi^2} - \alpha \kappa \frac{d^2U}{d\xi^2} - 6 \alpha (V^2 + U) \frac{dV}{d\xi} = 0. \]  

(13)

We postulate the following tanh series in Eq. (11), Eq. (3) and the transformation given in (4), the equation in (13) reduces to

\[ \kappa \frac{dV}{d\xi} = 2(V^2 + U)U + \kappa^2(1 - Y^2) \left[ -2Y \frac{dU}{dY} + (1 - Y^2) \frac{d^2U}{dY^2} \right] - \alpha \kappa \left[ (1 - Y^2) Y \frac{dU}{dY} - 6 (1 - Y^2) \frac{d^2U}{dY^2} \right] - 6 \alpha (V^2 + U) \frac{dV}{d\xi} = 0. \]

(14)

\[ \kappa \frac{dV}{d\xi} = 2(V^2 + U^2)V + \kappa^2(1 - Y^2) \left[ -2Y \frac{dU}{dY} + (1 - Y^2) \frac{d^2U}{dY^2} \right] - \alpha \kappa \left[ (1 - Y^2) Y \frac{dU}{dY} - 6 (1 - Y^2) \frac{d^2U}{dY^2} \right] - 6 \alpha (V^2 + U) \frac{dV}{d\xi} = 0. \]

(15)

Now, to determine the parameters \( m \) and \( n \), we balance the linear term of highest-order with the highest order nonlinear terms. So, in Eq. (14) we balance \( V^2 \) with \( U^2 V^2 \), to obtain \( 2m = 2 \), then \( m = 1 \). While in Eq. (15) we balance \( U^2 \) with \( V^2 U^2 \), to obtain \( 2n = 2 \), then \( n = 1 \). The tanh method admits the use of the finite expansion for both

\[ u_1(x, t) = U(Y) = a_0 + a_1 Y, \quad a_1 \neq 0, \]  

(16)

\[ u_2(x, t) = V(Y) = b_0 + b_1 Y, \quad b_1 \neq 0. \]  

(17)

Substituting \( U, U', U'', U''' \) and \( V, V', V'' \) from Eq. (16) and Eq. (17) respectively into Eqs.(14-15), then equating the coefficient of \( Y^i \), \( i = 0, 1, 2, 3 \), leads to the following nonlinear system of algebraic equations.

\[ Y^0 \text{ Coeff.} \]

\[ 2 a_0^2 + 2 a_1 b_0 - 6 a_0 b_0 \alpha - 6 b_0^2 b_1 \alpha + 2 b_1 \alpha^3 + b_1 \kappa \lambda \quad = 0 \]

\[ Y^1 \text{ Coeff.} \]

\[ a_0^2 a_1 + a_1 b_0^2 + 2 a_1 b_1 b_1 - 6 a_0 a_1 b_1 \alpha - 6 b_0 b_1^2 \alpha \quad - a_1 \kappa \lambda = 0 \]

\[ Y^2 \text{ Coeff.} \]

\[ 6 a_0 a_1^2 + 4 a_1 b_0 b_1 + 2 a_0 b_1^2 + 6 a_1^2 b_1 \alpha - 6 a_0^2 b_1 \alpha + 6 b_0^2 b_1 \alpha - 6 b_1^2 \alpha - 6 b_1 \kappa \lambda = 0 \]

\[ Y^3 \text{ Coeff.} \]

\[ a_1^2 + a_1 b_1^2 + 6 a_0 a_1 b_1 \alpha + 6 b_0 b_1^2 \alpha + a_1 \kappa^2 = 0 \]

\[ Y^4 \text{ Coeff.} \]

\[ a_1^2 + b_1^2 + \kappa^2 = 0, \]

and

\[ Y^0 \text{ Coeff.} \]

\[ 2 a_0^2 b_0 + 2 b_0^3 + 6 a_1^2 a_0 \kappa + 6 a_1 b_0^2 \alpha - 2 a_1 \kappa^2 - a_1 \kappa \lambda = 0 \]

\[ Y^1 \text{ Coeff.} \]

\[ 2 a_0 a_1 b_0 + a_1^2 b_1 + 3 b_0^2 b_1 + 6 a_0 a_1^2 \alpha + 6 a_1 b_0 b_1 \alpha - b_1 \kappa^2 = 0 \]

\[ Y^2 \text{ Coeff.} \]

\[ 2 a_1 b_0^3 + 4 a_0 a_1 b_1 + 6 b_0 b_1 - 6 a_0^2 a_1 \kappa + 6 a_1^3 \alpha - 6 a_1 b_0^2 \alpha + 6 a_1 b_1^2 \alpha + 8 a_1 \kappa^2 + a_1 \kappa \lambda = 0, \]

\[ Y^3 \text{ Coeff.} \]

\[ b_1^3 + a_1^2 b_1 + 6 a_1 a_0^2 \alpha - 6 b_0 a_1 b_1 \alpha + b_1 \kappa^2 = 0, \]

\[ Y^4 \text{ Coeff.} \]

\[ -b_1^2 - a_1^2 - \kappa^2 = 0. \]  

(18)

Solving the nonlinear systems of equations (18) with help of Mathematica we can get:

Case(1)

\[ a_0 = \pm \sqrt{a_1^2 + \kappa^2}, \quad b_0 = \pm a_1, \quad b_1 = \pm i \sqrt{a_1^2 + \kappa^2}, \]

and \( \lambda = 2(2 a_1^2 \pm b_0 \kappa) \),

The kink solitons solutions (1) take the forms,

\[ u(x, t) = \left( 1 \pm \tanh(k(x - \lambda t)) \right) \left( a_1^2 + \kappa^2 \pm a_0 \right), \quad \text{and} \]

\[ u(x, t) = \left( 1 \pm \coth(k(x - \lambda t)) \right) \left( a_1^2 + \kappa^2 \pm a_0 \right). \]  

(19)
Case(2)

\[ \lambda = 2(2\alpha x^2 \pm i\kappa), \quad a_0 = \pm \kappa, \quad a_1 = 0, \quad b_0 = 0, \]

and \( b_1 = \pm i\kappa; \) \hfill (20)

The kink solitons solutions(2) take the forms,

\[ u(x,t) = \pm \kappa \left( 1 + \tanh(k(x - \lambda t)) \right), \]

and \[ u(x,t) = \pm \kappa \left( 1 + \coth(k(x - \lambda t)) \right). \hfill (21) \]

The solitary wave and behavior of the solutions \( u_1(x,t), \) \( u_2(x,t) \) and \( u(x,t) \) are shown in Figure (1) for some fixed values of the parameters, \( (a_1 = 2, \alpha = 1, \kappa = 0.5) \)

we postulate the following tanh series in Eq. (4), Eq. (23) and the transformation, the equation (24) reduces to

\[ -\lambda(1 - Y^2) \frac{dU}{dy} + 3\alpha(V^2 + U^2)(1 - Y^2) \frac{dV}{dy} + \gamma k^2(1 - Y^2) \left( 2(3Y^2 - 1) \frac{dV}{dy} - 6Y(1 - Y^2) \frac{dU}{dy} + (1 - Y^2)^2 \frac{dU}{dy} \right) = 0, \hfill (25) \]

Substituting \( U, \ U', \ U'', \ U''' \) and \( V' \) from Eq. (27) and Eq. (28) respectively into Eq.(25,26), then equating the coefficient of \( Y^i \ i = 0, 1, 2, 3, 4 \) leads to the following nonlinear system of algebraic equations

\[ \begin{align*}
Y^0 & \quad \text{Coeff.} \quad 3a_0^2\alpha + 3b_0^2\alpha - 2\gamma k^2 - \lambda = 0 \\
Y^1 & \quad \text{Coeff.} \quad a_0a_1 + b_0b_1 = 0 \\
Y^2 & \quad \text{Coeff.} \quad -3a_0^2\alpha + 3a_1^2\alpha - 3b_0^2\alpha + 3b_1^2\alpha + 8\gamma k^2 + \lambda = 0 \\
Y^3 & \quad \text{Coeff.} \quad -a_0a_1 - b_0b_1 = 0 \\
Y^4 & \quad \text{Coeff.} \quad -a_1^2\alpha - b_1^2\alpha - 2\gamma k^2 = 0.
\end{align*} \hfill (29) \]

Solving these systems, We find the kink solitons solutions take the forms.

Case (1)

\[ \lambda = -2\gamma k^2, \quad a_0 = \pm \frac{\sqrt{4\alpha^2 \mp 2\gamma k^2}}{\sqrt{4}} \]

\[ b_1 = (\pm \frac{\sqrt{4\alpha^2 \mp 2\gamma k^2}}{\sqrt{4}}) \]

\[ a_2 = 0, \quad \text{and} \quad q = (a_1 - a_0) \tanh(k(x - \lambda t)), \quad \text{or} \]

\[ q = (a_1 - a_0) \coth(k(x - \lambda t)), \]

Case(2)

\[ \lambda = 3b_0^2\alpha - 2\gamma k^2, \quad a_1 = \pm \frac{b_0\sqrt{4\alpha^2 \mp 2\gamma k^2}}{\sqrt{4}}, \quad a_0 = 0, \quad \text{and} \quad b_1 = 0, \]

\[ q = b_0 \pm \frac{b_0\sqrt{4\alpha^2 \mp 2\gamma k^2}}{\sqrt{4}} \tanh(k(x - \lambda t)), \quad \text{or} \quad q = b_0 \pm \frac{b_0\sqrt{4\alpha^2 \mp 2\gamma k^2}}{\sqrt{4}} \coth(k(x - \lambda t)), \]

Case(3)

\[ \lambda = 3a_0^2\alpha - 2\gamma k^2, \quad b_1 = \pm \frac{b_0\sqrt{4\alpha^2 \mp 2\gamma k^2}}{\sqrt{4}} \]

\[ b_0 = 0, \quad \text{and} \quad a_1 = 0 \]

\[ q = a_0 = \pm \frac{b_0\sqrt{4\alpha^2 \mp 2\gamma k^2}}{\sqrt{4}} \tanh(k(x - \lambda t)), \quad \text{or} \quad q = a_0 = \pm \frac{b_0\sqrt{4\alpha^2 \mp 2\gamma k^2}}{\sqrt{4}} \coth(k(x - \lambda t)), \]

Case(4)

\[ \lambda = -2(1 + 3a_0^2\alpha)\gamma k^2, \quad a_2 = \sqrt{1 + \frac{2\gamma k^2}{\alpha}}, \]

\[ b_0 = \pm ia_0 \sigma_2, \quad b_1 = 1, \quad \text{and} \quad a_1 = \pm i\sigma_2, \]

\[ q = (\pm \sigma_2)(i \tanh(k(x - \lambda t)) - a_0) + (a_0 + i \tanh(k(x - \lambda t))), \hfill (30) \]
In terms tan method
Similar as the tanh method we can obtain the tan method through the equation (6)

\[ \lambda = 2 (\gamma \kappa^2 - \frac{3a_1^2}{b_1^2}) \]
\[ \sigma_1 = \pm \sqrt{\frac{a_0 + a_1^2 b_1^2}{a_0}} \]
\[ a_1 = i \omega_3, \quad b_0 = \frac{ia_0}{\sigma_1} \sigma_3, \]
\[ q = a_0 - \sigma_3 (\frac{a_0}{b_1} + i \tan(\kappa(x - \lambda t))) + ib_1 \tan(\kappa(x - \lambda t)) \]
\[ q = a_0 - \sigma_3 (\frac{a_0}{b_1} + i \cot(\kappa(x - \lambda t))) + ib_1 \cot(k(x - \lambda t)) \]

Case(2)
\[ \lambda = 2 \gamma \kappa^2, \quad a_1 = i \omega_3, \quad b_0 = 0, \quad \text{and} \quad a_0 = 0, \]
\[ q = i (b_1 - \sigma_3) \tan(\kappa(x - \lambda t)), \quad \text{or} \]
\[ q = i (b_1 - \sigma_3) \cot(\kappa(x - \lambda t)), \]

Case(3)
\[ \lambda = 3 b_0^2 \alpha + 2 \gamma \kappa^2, \quad a_1 = \pm \frac{\sqrt{\gamma \kappa}}{\sqrt{\alpha}}, \quad b_1 = 0, \quad \text{and} \quad a_0 = 0, \]
\[ q = i b_0 \pm \frac{\sqrt{\gamma \kappa} x}{\sqrt{\alpha}} \tan(\kappa(x - \lambda t)), \quad \text{or} \]
\[ q = i b_0 \pm \frac{\sqrt{\gamma \kappa} x}{\sqrt{\alpha}} \cot(\kappa(x - \lambda t)), \]

(31)
The solitary wave and behavior of the solutions \( u(x, t) \) and \( v(x, t) \) are shown in Figure(2) for some fixed values of the parameters, \( \lambda = 0.5, \kappa = 0.05 \)

Fig 2: The component \(|u|\), the component \(|v|\), and \(|\psi|\) of the example(2) in terms tanh method

Example 3.
The Hirota Equation(3). One of the most important model equations in nonlinear science is the nonlinear Schrodinger (NLS) equation,[14]

\[ i \eta_1 + \eta_{xx} + |\eta|^2 \eta = 0, \]

Physically, the NLS equation describes the modulation of weakly-nonlinear wave trains. In deep water, Benjamin and Feir [Benjamin and Feir(1967)] showed that an uniform wave train is unstable to long wave perturbations. Peregrine [Peregrine(1985)] and Yuen and Lake [Yuen and Lake(1982)] present a historical overview of fluid mechanics applications of the NLS equation and its physical origins. In the optical context, the NLS equation was derived by Hasegawa and Tappert [Hasegawa and Tappert(1973)]. It also describes the evolution of the slowly varying envelope of an optical pulse. Derived asymptotically from Maxwell’s equations, it assumes slow variation in the carrier frequency and the Kerr dependence. The NLS equation is central in understanding soliton propagation in optical fibres, which is of critical importance to the field of fibre-based telecommunications Wabnitz,Kodama and Aceves]. Motivated by these physical applications, the evolution of a NLS soliton has been studied extensively in both the physical and mathematical communities.

\[ \eta(x, t) = \varphi(x, t) + i \psi(x, t), \]

where \( \varphi(x, t) \) and \( \psi(x, t) \) are real functions. This will reduce Hirota equation to the coupled system

\[ -\lambda \kappa \frac{d \psi}{dt} + (\Psi^2 + \phi^2) \phi + \kappa^2 \frac{d \phi}{dt} = 0, \]
\[ -\lambda \kappa \frac{d \psi}{dt} + (\Psi^2 + \phi^2) \Psi + \kappa^2 \frac{d \psi}{dt} = 0, \]

(34)
We postulate the following tanh series in Eq. (33), Eq. (3) and the transformation given in (4), the equation (34) reduces to

\[ -\lambda (1 - Y^2) \frac{d \phi}{dY} + \]
\[ (\Psi^2 + \phi^2)(1 - Y^2) \frac{d \phi}{dY} + \gamma \kappa^2 (1 - Y^2) \left[ 2(3Y^2 - 1) \frac{d \phi}{dY} - 6 Y (1 - Y^2) \frac{d \phi}{dY} \right] = 0, \]
\[ -\lambda (1 - Y^2) \frac{d \psi}{dY} + (\Psi^2 + \phi^2)(1 - Y^2) \frac{d \psi}{dY} + \kappa^2 (1 - Y^2) \left[ 2(3Y^2 - 1) \frac{d \psi}{dY} - 6 Y (1 - Y^2) \frac{d \psi}{dY} \right] = 0, \]

(35)
Now, to determine the parameters \( m \) and \( n \), we balance the linear term of highest-order with the highest order nonlinear terms. then \( m = n = 1 \).The tanh method admits the use of the finite expansion for both

\[ \varphi(x, t) = \Phi(Y) = a_0 + a_1 Y, \quad a_1 \neq 0, \]
\[ \psi(x, t) = \Psi(Y) = b_0 + b_1 Y, \quad b_1 \neq 0, \]

(37)
Substituting from Eq. (37) and Eq. (38) respectively into Eq.(35-36), then equating the coefficient of \( Y^i, i = 0, 1, 2, 3 \) leads to the following nonlinear system of algebraic equations

\[ Y^0 \text{ Coeff.} \quad a_0^3 + a_0 b_0^2 + b_1 k \lambda = 0, \]
\[ Y^1 \text{ Coeff.} \quad 3a_0^2 a_1 + a_1 b_0^2 + 2a_0 b_1 b_2 - 2a_1 k \lambda = 0, \]
\[ Y^2 \text{ Coeff.} \quad 6a_0 a_1^2 + 4a_1 b_0 b_1 + 2a_0 b_2^2 - 2b_1 k \lambda = 0, \]
\[ Y^3 \text{ Coeff.} \quad a_1^3 + b_1^2 + 2k^2 = 0, \]

and

\[ Y^0 \text{ Coeff.} \quad a_0^3 b_0 + b_0^3 - a_1 k \lambda = 0, \]
\[ Y^1 \text{ Coeff.} \quad 2a_0 a_1 b_0 + a_0^2 b_1 + 3b_0^2 b_1 - 2b_1 k \lambda = 0, \]
Solving these systems, we find the soliton solutions take the forms

**Case (1)**

\[ \lambda = \pm 2i \kappa, \quad a_1 = \left( \pm \frac{\sqrt{2a_0^2 + \lambda^2}}{\sqrt{2}} \right), \quad b_1 = \pm i a_0, \quad \text{and} \quad b_0 = \pm i a_1, \]

\[ \eta = a_0 (1 \pm i \tanh(\kappa(x \pm 2\kappa t))) \pm \sqrt{\frac{2a_0^2 + \lambda^2}{2}} (\tanh(\kappa(x \pm 2\kappa t)) \pm i), \]

**Case (2)**

\[ \kappa = \frac{i \gamma}{2}, \quad b_1 = 0, \quad a_1 = -\frac{\gamma}{\sqrt{2}}, \quad b_0 = \frac{\gamma}{\sqrt{2}}, \quad a_0 = 0, \]

\[ \eta = \pm \sqrt{2}i \kappa (i \pm \tanh(\kappa(x \pm 2\kappa t))), \quad \text{or} \]

\[ \eta = \pm \sqrt{2}i \kappa (i \pm \coth(\kappa(x \pm 2\kappa t))), \]

The solitary wave and behavior of the solutions \( \varphi(x,t) \) and \( \psi(x,t) \) are shown in Figure (3) for some fixed values of the parameters, \( (a_0 = 1, \kappa = 0.5) \)

![Fig 3: the component \(|\varphi|\), the component \(|\psi|\), and \(|\eta|\) of the example(3)](image)

### 5. REFERENCES

4. CONCLUSIONS

The powerful tanh method was employed for analytic treatment of nonlinear coupled partial differential equations. The tanh method require transformation formulas. Traveling wave solutions, kinks solutions were derived. The performance of the tanh method show that these methods are reliable and effective. The applied methods will be used in further works to establish more entirely new solutions for other kinds of nonlinear equations.
