ABSTRACT
In this paper we propose an approach to solve multi-objective structural design problem using basic t-norm based fuzzy optimization programming technique. Here a planar truss structural model in fuzzy environment has been developed. In this structural model formulation, the objective functions are the weight of the truss and the vertical deflection of loaded joint; the design variables are the cross-sections of the truss members; the constraints are the stresses in members. A classical truss optimization example is presented here in to demonstrate the efficiency of our propose optimization approach. The test problem includes a three-bar planar truss subjected to a single load condition. This approximation approach is used to solve this multi-objective structural optimization model. The model is illustrated with numerical examples.

Keywords
Multi-objective Optimization, Triangular Norm, Fuzzy Set, Structural Optimization

1. INTRODUCTION
Optimization is the process of minimizing or maximizing an objective function (e.g. cost, weight) of a structural system which has been frequently employed as the evaluation criterion in structural engineering applications. But in the practical optimization problems, usually more than one objective are required to be optimized, such as minimum mass or cost, maximum stiffness, minimum displacement at specific structural points, maximum natural frequency of free vibration, and maximum structural strain energy. This makes it necessary to formulate a multi-objective optimization problem. The first note on multi-objective optimization was given by Pareto; since then the determination of the compromise set of a multi-objective problem is called Pareto optimization. That is why the application of different optimization technique [5, 19, 20-24] to structural problems has attracted the interest of many researchers.

In real life, the data cannot be recorded or collected precisely due to human errors or some unexpected situations. So one may consider ambiguous situations like vague parameters, non-exact objective and constraint functions in the problem and it may be classified as a non-stochastic imprecise model. Here fuzzy set theory may provide a method to describe or formulate this imprecise model. Zadeh [2] first gave the concept of fuzzy set theory for handling uncertainty that is due to imprecision rather than to randomness. Later on Bellman and Zadeh [3] used the fuzzy set theory to the decision making problem. Zimmermann [4] proposed a fuzzy multi-criteria decision making set, defined as the intersection of all fuzzy goals and their constraints.

In practical, the problem of structural design may be formed as a typical non-linear programming problem with non-linear objective functions and constraints functions in fuzzy environment. Some researchers applied the fuzzy set theory to Structural model. For example Wang et al. [1] first applied \(\alpha\)-cut method to structural designs where the non-linear problems were solved with various design levels \(\alpha\), and then a sequence of solutions are obtained by setting different level-cut value of \(\alpha\). Rao [14] applied the same \(\alpha\)-cut method to design a four-bar mechanism for function generating problem. Structural optimization with fuzzy parameters was developed by Yeh et al. [7]. In 1989, Xu [6] used two-phase method for fuzzy optimization of structures. In 2004, Shih et al. [15] used level-cut approach of the first and second kind for structural design optimization problems with fuzzy resources. Shih et al. [16] develop an alternative \(\alpha\)-level-cuts methods for optimum structural design with fuzzy resources in 2003. Dey et al. [5] optimize multi-objective structural model with fuzzy coefficient i.e. generalized fuzzy number and its total \(\lambda\)-integral value.

Alsina et al. [8] introduced the t-norm into fuzzy set theory and suggested that the t-norms be used for the intersection of fuzzy sets. Different types of t-norms theory and their fuzzy inference methods were introduced by Gupta et al. [9]. The extension of fuzzy implication operators and generalized fuzzy methods of cases were discussed by Ruan et al. [10]. Pei et al. [11] introduced the extended t-norms and another kind of fuzzy universal algebras. Kaymak et al. [12] use weighted extension of (Archimedean) fuzzy t-norms in optimization of various criteria model. Samanta et al. [13] solve portfolio selection model using extended t-norm based fuzzy optimization technique.

In this paper we propose an approach to solve multi-objective structural model using t-norms based fuzzy optimization programming technique. In this structural model formulation, the objective functions are the weight of the truss and the vertical deflection of loaded joint; the design variables are the cross-sections of the truss members; the constraints are the stresses in members. The test problem includes a three-bar planar truss subjected to a single load condition. This
approximation approach is used to solve this multi-objective structural optimization model.

The remainder of this paper is organized in the following way. In section 2, we discuss about structural optimization model. In section 3, we discuss about mathematics Prerequisites. In section 4, we discuss about t-norm and extended n-ary t-norms. In section 5, we discuss about the basic t-norm and their generalization with weight factors. In section 6, we discuss about weighted fuzzy aggregation. In section 7, we proposed the technique to solve multi-objective non-linear programming problem using extended t-norm based fuzzy optimization. In section 8, we solve multi-objective structural model using extended t-norms based fuzzy optimization. In section 9, numerical solution of structural model of three bar truss and compared results by using different extended weighted t-norms. Finally we draw conclusions in section 10.

2. MULTI-OBJECTIVE STRUCTURAL MODEL

In the design of optimal structure i.e. lightest weight of the structure and minimum deflection of loaded joint that satisfies all stress constraints in members of the structure. To bar truss structure system the basic parameters (including the elastic modulus, material density, the maximum allowable stress, etc.) are known and the optimization’s target is that identify the optimal bar truss cross-section area so that the structure is of the smallest total weight, the minimum nodes displacement, in a given load conditions.

The multi-objective Structural model can be expressed as

\[
\begin{align*}
\text{minimize } & \mathcal{W}(A) \\
\text{subject to } & \sigma(A) \leq \sigma_0 \\
& A_{\min} \leq A \leq A_{\max}
\end{align*}
\]

where \( A = [A_1, A_2, \ldots, A_n]^T \) are design variables for the cross section, \( n \) is the group number of design variables for the cross section bar, \( \mathcal{W} = \sum_{i=1}^{n} \rho_i A_i L_i \) is the total weight of the structure, \( \sigma(A) \) is the deflection of loaded joints \( L_i \), \( A_i \) and \( \rho_i \) were the bar length, cross section area, and density of the \( i \)-th group bars respectively. \( \sigma(A) \) is the stress constraint and \( \sigma_0 \) is maximum allowable stress of the group bars under various conditions, \( A_{\min} \) and \( A_{\max} \) are the minimum and maximum cross section area respectively.

3. PREREQUISITE MATHEMATICS

3.1 Fuzzy Set

Let X is a set (space), with a generic element of X denoted by \( x \), that is \( X(x) \). Then a Fuzzy set (FS) is defined as

\[ A = \{ (x, \mu_A(x)) : x \in X \} \]

where \( \mu_A : X \to [0, 1] \) is the membership function of FS \( A \). \( \mu_A(x) \) is the degree of membership of the element \( x \) to the set \( A \).

3.2 \( \alpha \)-Level Set or \( \alpha \)-cut of a Fuzzy Set

The \( \alpha \)-level set of the fuzzy set \( A \) of X is a crisp set \( A_\alpha \) that contains all the elements of \( X \) that have membership values greater than or equal to \( \alpha \) i.e.

\[ A = \{ x : \mu_A(x) \geq \alpha, x \in X, \alpha \in [0, 1] \} . \]

3.3 \( \alpha \)-Level Set or \( \alpha \)-cut of a Fuzzy Set

The \( \alpha \)-level set of the fuzzy set \( A \) of X is a crisp set \( A_\alpha \) that contains all the elements of \( X \) that have membership values greater than or equal to \( \alpha \) i.e.

\[ A = \{ x : \mu_A(x) \geq \alpha, x \in X, \alpha \in [0, 1] \} . \]

3.4 Convex Fuzzy Set

A fuzzy set \( A \) of the universe of discourse \( X \) is convex if and only if for all \( x_1, x_2 \in X \),

\[ \mu_A(\lambda x_1 + (1-\lambda) x_2) \geq \min(\mu_A(x_1), \mu_A(x_2)) \] when \( 0 \leq \lambda \leq 1 \).

3.5 Normal Fuzzy Set

A fuzzy set \( A \) of the universe of discourse \( X \) is called a normal fuzzy set implying that there exist at least one \( x \in X \) such that \( \mu_A(x) = 1 \).

4. QUASI T-NORM

Let \( T: [0, 1] \times [0, 1] \to [0, 1] \) be a function satisfying the following axioms

\[ a) T(a, b) = T(b, a), \forall a, b \in [0, 1] \]
\[ b) T(T(a, b), c) = T(a, T(b, c)), \forall a, b, c \in [0, 1] \]
\[ c) T(a, b) \leq T(a, c) \text{ with } b \leq c, \forall a, b, c \in [0, 1] \]
\[ d) T(0, 0) = 0, T(1, 1) = 1 \]

4.1 T-Norm

A quasi-triangular norm \( T \) is called a triangular norm (or t-norm) if it satisfies

\[ T(a, 1) = a, \forall a \in [0, 1] \]

4.2 Extended n-ary quasi-t-norms

For the purpose of operations of multiple fuzzy sets, it is useful to define the notation of multi-dimensional t-norms. Let \( [0, 1]^n \) be an n-dimensional cube and \( (x_1, x_2, x_3, \ldots, x_n) \),

\[ (z_1, z_2, \ldots, z_n) \in [0, 1]^n \]

A mapping \( T: [0, 1]^n \to [0, 1] \) is called an n-dimensional quasi-t-norm if it satisfies the following conditions:

\[ a) T(x_1, \ldots, x_{i-1}, x_i, x_{i+1}, \ldots, x_n) \]
\[ = T(x_1, \ldots, x_{i-1}, x_j, x_{i+1}, \ldots, x_j, \ldots, x_n) \]
\[ b) T(T(x_1, \ldots, x_{i-1}, x_i), x_{i+1}, \ldots, x_{2n-1}) \]
\[ = T(x_1, \ldots, x_{n-1}, T(x_i, x_{i+1}, \ldots, x_{2n-1})) \]
\[ c) \text{For } T(x_1, x_2, \ldots, x_n) \leq (z_1, z_2, \ldots, z_n) \Rightarrow \]
\[ T(x_1, x_2, \ldots, x_n) \leq T(z_1, z_2, \ldots, z_n) \text{ with } x_i = z_i \text{, for some } i \text{ and } x_i \leq z_i \text{ for some } i, i = 1, 2, 3, \ldots, n. \]
\[ d) T(0, \ldots, 0) = 0, T(1, \ldots, 1) = 1 \]
4.3 Extended n-ary t-norms
An n-dimensional quasi-t-norm T is called n-dimensional t-norm if it satisfies
\[ T(1, 1, ..., 1, x_i, 1, ..., 1) = x_i \]
Due to associative law it is easy to extend a triangular norm T into n arguments. The n-ary operation \( T_n \) on \([0,1] \) satisfies the following properties
(i) \( T_n(x_1, x_2, ..., x_n) = T_n(x_{\sigma(1)}, x_{\sigma(2)}, ..., x_{\sigma(n)}) \) where \( \sigma \) is a permutation of \([1,2,..,n] \) (Commutativity)
(ii) \( T_n(x_1, x_2, ..., x_n) = \sum_{i=1}^{n} T_i(x_{j_1}, x_{j_2}, ..., x_{j_n}) \) (Associativity)
(iii) \( (\forall i \in N_n) (x_i \leq x') \Rightarrow T_n(x_1, x_2, ..., x_n) \leq T_n(x_1, x_2, ..., x'_{n}) \) (Monotonicity)
(iv) \( T_n(x_1, x_2, ..., x_{i-1}, x_i, x_{i+1}, ..., x_n) = T(x_1, x_2, ..., x_i, x_i, x_{i+1}, ..., x_n) \) (Identity law)
A t-norm \( T_n \) is said to be continuous if T is continuous function on \([0,1] \). From the above, we may call \( T_n \) is an extension of triangular norm.

5. BASIC BINARY T-NORMS AND THEIR GENERALIZATION WITH WEIGHT FACTORS
Minimum t-norm: \( T_M(a, b) = \min\{a, b\} \) and extension in n-ary of this t-norm \( T_M(x_1, x_2, ..., x_n) = \min\{x_1, x_2, ..., x_n\} \) and extended form with weights the above t-norm \( T_W^M(x_1, W_1, x_2, W_2, ..., x_n, W_n) = \min\{W_1x_1, W_2x_2, ..., W_nx_n\} \)
Probabilistic t-norm: \( T_P(a, b) = ab \) and extension in n-ary of this t-norm \( T_P(x_1, x_2, ..., x_n) = x_1x_2...x_n = \prod_{i=1}^{n} x_i \) and extended form with weights the above t-norm \( T_W^P(x_1, W_1, x_2, W_2, ..., x_n, W_n) = \prod_{i=1}^{n} W_ix_i \)
Lukasiewicz t-norm (bounded t-norm): \( T_L(a, b) = \max\{0, a + b - 1\} \) and extension in n-ary of this t-norm \( T_L(x_1, x_2, ..., x_n) = \max\{\sum_{i=1}^{n} x_i - n + 1, 0\} \) and extended form with weights the above t-norm \( T_W^L(x_1, x_2, W_1, x_2, W_2, ..., x_n, W_n) = \max\{\sum_{i=1}^{n} W_ix_i - (n-1), 0\} \).

6. WEIGHTED FUZZY AGGREGATION
Weighted Aggregation has been used quite extensively especially in fuzzy decision-making, where the weights are used to represent the relative importance the decision maker attaches to different decision criterion (goals or constraints). Weighted aggregation of fuzzy sets by using t-norms has been considered first by Yager [17]. He proposed to modify the membership functions with the associated weight factors before the fuzzy aggregation. The weighted aggregation is then the aggregation of the modified membership functions.

A general form of this idea gives the weighted aggregation function [18]
\[ D(x, W) = T\{I(\mu_1(x), W_1), I(\mu_2(x), W_2), ..., I(\mu_k(x), W_k)\} \] (2)
Where \( W \) is a vector of weight factor \( W_i \in [0,1] \) \( i = 1, 2, ..., k \) associated with the aggregated membership function \( \mu_i(x) \).
\( T \) is t-norm and \( I \) is a function of two variables that transforms the membership functions with
\[ \sum_{i=1}^{k} W_i = 1, W_i \geq 0 \].

7. MATHEMATICAL ANALYSIS
7.1 General Fuzzy Non-linear Programming (FNLP) Technique to solve Multi-Objective Non-Linear Programming Problem (MONLP):
A Multi-Objective Non-Linear Programming (MONLP) or Vector Minimization problem (VMP) may be taken in the following form:
\[ \min f(x) = [f_1(x), f_2(x), ..., f_k(x)]^T \] (3)
such that
\[ x \in X = \{x \in R^n : g_j(x) \leq 0 \ or \ or \ g_j(x) \geq b_j \ \text{for} \ j = 1, 2, 3, ..., m \}
\] and \( l_j \leq x_i \leq u_i \ (i = 1, 2, 3, ..., n) \)
Zimmermann (1978) showed that fuzzy programming technique can be used to solve the multi-objective programming problem.
To solve MONLP problem, following steps are used:
**Step 1:** Solve the MONLP (3) as a single objective non-linear programming problem using only one objective at a time and ignoring the others, these solutions are known as ideal solution.

**Step 2:** From the result of step 1, determine the corresponding values for every objective at each solution derived. With the values of all objectives at each ideal solution, pay-off matrix can be formulated as follows:
\[ f_1(x) \quad f_2(x) \quad ... \quad f_k(x) \]
\[ x^1 \quad f_1^*(x^1) \quad f_2^*(x^1) \quad ... \quad f_k^*(x^1) \]
\[ x^2 \quad f_1^*(x^2) \quad f_2^*(x^2) \quad ... \quad f_k^*(x^2) \]
... ...
... ...
... ...
\[ x^k \quad f_1^*(x^k) \quad f_2^*(x^k) \quad ... \quad f_k^*(x^k) \]
Here \( x^1, x^2, ..., x^k \) are the ideal solutions of the objectives \( f_1(x), f_2(x), ..., f_k(x) \) respectively.
So \( U_r = \max \{f_r(x^1), f_r(x^2), ..., f_r(x^k)\} \) and \( L_r = f_r(x^r) \) for \( r = 1, 2, ..., k \).
Where \( U_r \) and \( L_r \) be upper and lower bounds of the \( r^{th} \) objective function \( f_r(x) \) for \( r = 1, 2, 3, \ldots, k \).

**Step 3:** Using aspiration level of each objective of the MONLP (3) may be written as follows:

Find \( x \) so as to satisfy

\[
f_r(x) \leq L_r \quad \text{with tolerance } P_r \quad \text{for } r = 1, 2, 3, \ldots, k
\]

\[x \in X. \quad l_i \leq x_i \leq u_i \quad (i = 1, 2, 3, \ldots, n)\]

Here objective functions of (3) are considered as fuzzy constraints. These types of fuzzy constraints can be quantified by eliciting a corresponding membership function:

\[
\mu_r(f_r(x)) = \begin{cases} 0 & \text{if } f_r(x) \geq U_r \\ \frac{U_r - f_r(x)}{U_r - L_r} & \text{if } L_r \leq f_r(x) \leq U_r \\ 1 & \text{if } f_r(x) \leq L_r \end{cases} \quad (4)
\]

\[
\mu_r(f_r(x))
\]

**Figure 1: Membership function for objective functions \( f_r(x) \)**

After determining the different membership functions of objective functions, one can adopt following types of fuzzy decision using (2)

i) According to the extension of the weighted Zadeh’s minimum \( t \)-norm operator

Maximize \( \alpha \)

subject to \( W_r \mu_r(f_r(x)) \geq \alpha \)

\[x \in X, \quad W_r \geq 0, \quad \sum_{r=1}^{k} W_r = 1;\]

ii) According to the extension of the weighted bounded \( t \)-norm operator

Maximize \( \mu^D_W(x;W) = \max \left\{ \sum_{r=1}^{k} W_r \mu_r(f_r(x)) - k + 1, 0 \right\} \)

subject to \( 0 \leq \mu_r(f_r(x)) \leq 1 \)

\[x \in X, \quad W_r \geq 0, \quad \sum_{r=1}^{k} W_r = 1;\]

iii) According to the extension of the weighted Probabilistic \( t \)-norm operator

Maximize \( \mu^P_D(x;W) = \prod_{r=1}^{k} (\mu_r(f_r(x)))^{W_r} \)

subject to \( 0 \leq \mu_r(f_r(x)) \leq 1 \)

\[x \in X, \quad W_r \geq 0, \quad \sum_{r=1}^{k} W_r = 1;\]

**Step 4:** Solving any one among five equations (5 to 7) we will get optimal solution of (3).

**7.2. Complete Optimal Solution**

\( x^* \) is said to be a complete solution to the MONLP (3) if and only if there exists \( x \in X \) such that \( f_r(x^*) \leq f_r(x) \) for \( r = 1, 2, \ldots, k \) and for all \( x \in X \). However, when the objective functions of the MONLP conflict with each other, a complete optimal solution does not always exist and hence the Pareto Optimality Concept arises and it is defined as follows.

**7.3. Pareto Optimal Solution**

\( x^* \) is said to be a Pareto optimal solution to the MONLP (3) if and only if there does not exist another \( x \in X \) such that \( f_r(x^*) \leq f_r(x) \) for all \( r = 1, 2, \ldots, k \) and \( f_j(x) \neq f_j(x^*) \) for at least one \( j \in \{1, 2, \ldots, k\} \).

**8. FUZZY PROGRAMMING TECHNIQUE IN MULTI-OBJECTIVE MODEL**

To solve the above MOSOP (1), step 1 of (7.1) is used. After that according to step 2 pay-off matrix formulated as follows:

\[
\begin{bmatrix}
\alpha_1 & \delta(A) \\
\alpha_2 & \delta(A)
\end{bmatrix}
\]

\[
\begin{bmatrix}
WT(A) & \delta(A) \\
WT(A) & \delta(A)
\end{bmatrix}
\]

After that according to step 2, the bounds of objective are \( U_r, L_r \) for weight function \( WT(A) \) (where \( L_r \leq WT(A) \leq U_r \) and the bounds of objective are \( U_r, L_r \) for deflection function \( \delta(A) \) (where \( L_r \leq \delta(A) \leq U_r \)) are identified.

Above MOSOP reduces to a FMOSOP as follows:

Find \( A \)

Such that

\[
WT(A) \leq L_1 \quad \text{with maximum allowable tolerance } R_1 = U_1 - L_1
\]

\[
\delta(A) \leq L_2 \quad \text{with maximum allowable tolerance } R_2 = U_2 - L_2
\]

\[
\sigma(A) \leq \sigma_0 \quad A_{\text{min}} \leq A \leq A_{\text{max}}
\]
Here for simplicity linear membership functions \( \mu_{WT}(WT(A)) \) and \( \mu_{\delta}(\delta(A)) \) for the objective functions \( WT(A) \) and \( \delta(A) \) respectively are defined as follows:

\[
\mu_{WT}(WT(A)) = \begin{cases} 
1 & \text{if } WT(A) \leq L_1 \\
(U_1-WT(A)) & \text{if } L_1 \leq WT(A) \leq U_1 \\
0 & \text{if } WT(A) \geq U_1 
\end{cases}
\]

\[
\mu_{\delta}(\delta(A)) = \begin{cases} 
1 & \text{if } \delta(A) \leq L_2 \\
(U_2-\delta(A)) & \text{if } L_2 \leq \delta(A) \leq U_2 \\
0 & \text{if } \delta(A) \geq U_2 
\end{cases}
\]

After determining the different membership functions for each of the objective functions, one can adopt following three types fuzzy decision using t-norms are

1) According to the extension of the weighted Zadeh’s minimum t-norm operator

\[
\text{maximize } \alpha \\
\text{subject to } W_1\mu_{WT}(WT(A)) \geq \alpha, \ W_2\mu_{\delta}(\delta(A)) \geq \alpha,
\]

\[
\sigma(A) \leq [\sigma], \quad A_{\min} \leq A \leq A_{\max}, \\
W_1 \geq 0, W_2 \geq 0, W_1 + W_2 = 1;
\]

2) According to the extension of the weighted bounded t-norm operator

\[
\text{maximize } \{W_1\mu_{WT}(WT(A)) + W_2\mu_{\delta}(\delta(A)) - 1,0\} \\
\text{subject to } 0 \leq \mu_{WT}(WT(A)) \leq 1, \ 0 \leq \mu_{\delta}(\delta(A)) \leq 1,
\]

\[
\sigma(A) \leq [\sigma], \quad A_{\min} \leq A \leq A_{\max}, \\
W_1 \geq 0, W_2 \geq 0, W_1 + W_2 = 1;
\]

3) According to the extension of the weighted Probabilistic t-norm operator

\[
\text{maximize } \left(\mu_{WT}(WT(A))\right)^{w_1} \left(\mu_{\delta}(\delta(A))\right)^{w_2} \\
\text{subject to } 0 \leq \mu_{WT}(WT(A)) \leq 1, \ 0 \leq \mu_{\delta}(\delta(A)) \leq 1,
\]

\[
\sigma(A) \leq [\sigma], \quad A_{\min} \leq A \leq A_{\max}, \\
W_1 \geq 0, W_2 \geq 0, W_1 + W_2 = 1;
\]

Solving any one among five equations (8) to (10) we will get optimal solution of (1).

9. NUMERICAL SOLUTION OF A MULTI-OBJECTIVE STRUCTURAL OPTIMIZATION MODEL OF A THREE BAR TRUSS

A well-known three bar [16] planar truss structure is considered. The design objective is to minimize weight of the structural \( WT(A_1,A_2) \) and minimize the vertical deflection \( \delta(A_1,A_2) \) at loading point of a statistically loaded three-bar planar truss subjected to stress \( \sigma_i(A_1,A_2) \) constraints on each of the truss members \( i = 1,2,3 \).

Figure 2: Design of the three-bar planar truss

The multi-objective optimization problem can be stated as follows:

\[
\text{minimize } WT(A_1,A_2) = \rho L \left(2\sqrt{A_1} + A_2\right), \\
\text{minimize } \delta(A_1,A_2) = \frac{P L}{E(A_1 + \sqrt{2}A_2)}
\]

\[
\text{Subject to } \sigma_1(A_1,A_2) = \frac{P L A_2}{\sqrt{2}A_1 + \sqrt{2}A_2} \leq [\sigma_f], \\
\sigma_2(A_1,A_2) = \frac{P L A_2}{A_1 + \sqrt{2}A_2} \leq [\sigma_f], \\
\sigma_3(A_1,A_2) = \frac{P L A_2}{2A_1 + \sqrt{2}A_2} \leq [\sigma_c], \\
A_1^{\min} \leq A_1 \leq A_1^{\max}, i = 1,2.
\]

The input data for MOSOP (11) is given in table 1.

Solution: According to step 2 pay off matrix is formulated as follows;

\[
\begin{bmatrix}
WT(A_1,A_2) \\
\delta(A_1,A_2)
\end{bmatrix} = \\
\begin{bmatrix}
2.638958 \\
14.64102 \\
24
\end{bmatrix}
\]

Here \( U_1 = 19.14214, L_1 = 2.638958, U_2 = 14.64102, L_2 = 1.656854 \), Here linear membership function for the objective functions \( WT(A_1,A_2) \) and \( \delta(A_1,A_2) \) is defined as follows:
\[ \mu_{WT}(A_1, A_2) = \begin{cases} 1 & \text{if } WT(A_1, A_2) \leq 2.638958 \\ \frac{19.14214 - WT(A_1, A_2)}{16.503182} & \text{if } 2.638958 \leq WT(A_1, A_2) \leq 19.14214 \\ 0 & \text{if } WT(A_1, A_2) \geq 19.14214 \end{cases} \]

\[ \mu_{\delta}(A_1, A_2) = \begin{cases} 1 & \text{if } \delta(A_1, A_2) \leq 1.656854 \\ \frac{14.64102 - \delta(A_1, A_2)}{12.984166} & \text{if } 1.656854 \leq \delta(A_1, A_2) \leq 14.64102 \\ 0 & \text{if } \delta(A_1, A_2) \geq 14.64102 \end{cases} \]

Figure 3: membership for objective weight function \( WT(A_1, A_2) \)

Figure 4: Rough sketch of membership for objective deflection functions \( \delta(A_1, A_2) \)

Table 1: input data for MOSOP (11) is given as follows:

<table>
<thead>

For more importance on Structural Weight, the extension of the Minimum t-norm operator gives minimum weight.
For more importance on deflection, the extension of the weighted Minimum t-norm operator gives minimum deflection.

10. CONCLUSIONS
In this paper, we have proposed a multi-objective structural optimization model. Here binary t-norms are expressed into extended n-ary t-norms and discussed their basic properties. The said model is converted into an equivalent single objective problem and it is solved by using t-norms based fuzzy decision making technique. A main advantage of the proposed method is that it allows the user to concentrate on the actual limitations in a problem during the specification of the flexible objectives. This approximation method can be applied to optimize different models in various fields of engineering and sciences.

Conflict of interests: The authors declare that there is no conflict of interests.
