ABSTRACT
Present paper is an application study of intuitionistic fuzzy optimization technique in agricultural production planning problem particularly a case of smallholder farmer in north Bihar, India. Generally, the crop planning problem is formulated as linear programming problems, but in realistic situation there are many uncertain factors in agricultural production planning problems and hence future profits for crop are imprecise and uncertain values. Therefore, we propose a model of crop planning using intuitionistic fuzzy optimization technique.

General Terms
Multi-Objective linear programming, Crop production planning.

Keywords
Multi-Objective linear programming, Fractional programming approach, Intuitionistic fuzzy sets, Intuitionistic fuzzy optimization.

1. INTRODUCTION
In agricultural production planning problems, one of the major objective is to maximize the profit under minimum investment with limited land. But a general problem of agricultural production planning is not limited to profit optimization with cost minimization. A realistic crop production planning problem comprise of several objectives like optimization of input resource like: man hours, machine hours, fertilizers, water requirement and many more. These objectives are also conflicting in nature. Further, the cost of cultivation and prices of food grains are fluctuating in nature as these depend on many uncontrolled parameters. Thus, these constraints are imprecise, vague and uncertain in nature. Due to such features of crop production problems, the crisp multi-objective methods are not very suitable for developing the cropping models. Thus Zimmermann [23] first used the concept of fuzzy set given by Zadeh [22] and studied fuzzy programming and linear programming with several objectives. Further, many authors like Tanaka and Asai [18], Luhandjula [11], Itoh et.al [19], Toyonaga et al [20], Sarkar et al [15], Sharma et al [16], Garg and Singh [10], worked on crop planning models in fuzzy environment. As the theory of fuzzy sets was extended to intuitionistic fuzzy sets theory by Atanassov [1, 2], Angelov [3] studied the optimization in an intuitionistic fuzzy environment. The theory of linear programming in intuitionistic fuzzy set was further enriched by several authors as Dubey et al [8, 9], Jana and Roy [4] Luo and Yu [21], Nachammai Thangaraj [13] and Nagoorgani [14]. Recently Bharati and Singh [6, 7], have studied the multi-objective linear programming problems in intuitionistic fuzzy environment.

Agriculture is one of the vital sectors of Indian economy. Sixty seven per cent of India’s population lives in rural areas, and three-fourth of the people of rural populations depend on agriculture and allied activities for their livelihoods (Census of India. 2011). Although the contribution of agriculture to India’s gross domestic product (GDP) is 15%, but this sector is the main source of employment in Indian economy, comprising 55% of the country labour force (Census of India. 2011). Major part of agriculture in the country is rain fed, extending to over 87 millimetres per hectare and constituting nearly 61% of net cultivated area. Hence monsoons play a critical role in Indian agriculture in determining whether the harvest will be bumper, average or poor in any given year. Bihar lies in the river plains of the basin of the Ganga. It is endowed with fertile alluvial soil with abundant water resources, especially ground water resources. This makes the agriculture of Bihar rich and diverse. Rice, wheat, and maize are the major cereal crops of Bihar. Arhar, urad, moong, gram, pea, lentils and khesaria are some of the pulses cultivated in Bihar. Bihar is one of major producer of mango, banana, and guava. Sugar cane and jute are two other major cash crops of Bihar.

However, rice is cultivated in almost all the districts of Bihar. Autumn rice, aghani rice and summer rice are three different varieties of rice grown at three different times of the year. The average production of rice in Bihar is around 5 million tonnes each year. Some five decades back wheat cultivated was very restricted in Bihar. After green revolution success farmers started growing wheat on a larger scale and thus wheat now occupies the status of major crop of the Rabi season. The average annual wheat production is approximately 40-45 tonnes. Maize is also cultivated with the average annual production level of approximately 1.5 million tonnes and a steady positive trend in production. The leading producer districts are Khagaria and Saharsa. Pulses such as moong, Arhar, peas and khesaria are grown more in southern Bihar than in northern Bihar. The leading districts are Patna, Bhojpur, Aurnagabad and Nalanda. The total area under vegetables cultivation is currently around 11% of the state gross sown area and now have increasing trend. The important vegetables crops include potato, onion, tomato, cauliflower and Brinjal. Hajipur in Vaishali is famous for an early variety of cauliflower that reaches market in the last week of September. Apart from Patna and Nalanda where vegetables production is quite extensive, the other districts with high shares in total vegetables production are Vaishali, Muzaffarpur, west Champaran, east Champaran, Katihar and Begusarai.
Bihar has a geographical area of 9,360,000 hectares with three important agro-climate zones: north-west, north-east and south. The north-west zones has 13 district and receives an annual rainfall of 1040-1450 mm. The soil is mostly loam and sandy loam. The north-east zones has 8 districts, it receives rainfall ranging from 1200-1700 mm and has loam and clay loam soils. Finally the south zone (17 districts) receives an average annual rainfall of 990-1300 mm. Its soils are sandy loam, clay and clay loam. The average rainfall in Bihar is 1052.6 mm. The rainfall in Bihar is largely due to southwest monsoons which accounts for around 85% of total rainfall in the state.

First, we introduce basic terms and definition related to the paper and then fuzzy optimization technique, intuitionistic fuzzy optimization technique, crop production planning problem and mathematical formulation of the problems and finally follows the conclusion of studies.

2. PRELIMINARIES

2.1 Multi objective linear programming problem
In general, a multi objective optimization problem with p objectives, q constraints and n decision variables, is follows as:

\[
\begin{align*}
\text{Max} & \quad \{f_1, f_2, ..., f_p\} \\
\text{Such that} & \quad g_j(x) \leq 0, \quad j = 1, 2, ..., q \\
X & \quad = \{x_1, x_2, ..., x_n\} \\
x_i & \geq 0, \quad i = 1, 2, ..., n
\end{align*}
\]

(1)

2.2 Complete solution
\(x^0\) is said to be a complete optimal solution for problem (1) if there exist \(x^0 \in X\) such that \(f_k(x^0) \leq f_k(x)\) for all \(x \in X\). However, in general such complete optimal solutions that simultaneously maximize all of the multiple-objective function do not exist, especially when the objective functions are conflicting in nature. Thus instead of a complete optimal solution a solution concept, called Pareto optimality was introduced in multi-objective programming.

2.3 Pareto-Optimality
\(x^0 \in X\) is said to be a Pareto optimal solution for (1) if there does not exist another \(x \in X\) such that \(f_k(x^0) \leq f_k(x)\) for all \(k = 1, 2, ..., p\) and \(f_j(x^0) < f_j(x)\) for at least one \(j = 1, 2, ..., p\).

2.4 Linear fractional programming approach
Let there be s objective out of k objectives such that their ratio is to maximized. For simplicity let us restrict number of such objectives to two and let these two linear objectives are \(f_p(x) > 0\) and \(f_q(x) > 0\) whose ratio forms a new objective function, giving rise to linear fractional programming as

\[
\text{Maximize} \quad \frac{f_p(x)}{f_q(x)}
\]

(2)

**Proposition**
As we assume that \(f_p(x) > 0\) and \(f_q(x) > 0\), therefore (2) is equivalent to

\[
\text{Maximize} \quad f_p(x) - \sigma f_q(x) > 0
\]

Such that

(3)

Where \(\sigma\) is a positive real number, which is a restriction that the ratio should always greater than a level \(\sigma\).

2.5 Intuitionistic fuzzy sets
An intuitionistic fuzzy sets \(\tilde{A}\) assigns to each element \(x\) of the universe \(X\) a membership degree \(\mu_A(x) \in [0, 1]\) and non-membership degree \(\nu_A(x) \in [0, 1]\) such that \(\mu_A(x) + \nu_A(x) \leq 1\). A IFs mathematically represented as \(\{(x, \mu_A(x), \nu_A(x)) | x \in X \}\) where, \(1 - \mu_A(x) - \nu_A(x)\) is called hesitancy margin.

**Example**
Let \(A\) be set of countries with elected government and let \(X\) be a member of \(A\). Let \(M(x)\) be the percentage of the electorate that voted for the government, \(N(x)\) the percentage that voted against. If we take \(\mu_A(x) = \frac{M(x)}{100}\), \(\nu_A(x) = \frac{N(x)}{100}\), then \(\mu_A(x)\) gives the degree of support, \(\nu_A(x)\) the degree of opposition and \(h(\tilde{A}) = 1 - \mu_A(x) - \nu_A(x)\) stand for indeterminacy which is the portion that cast bad votes: invalid votes, abstinent.

2.6 Intuitionistic Fuzzy Number
An intuitionistic fuzzy set (IFS) \((\tilde{A}, \mu_A, \nu_A)\) of real numbers is said to be an intuitionistic fuzzy number if \(\mu_A\) and \(\nu_A\) are fuzzy numbers. Hence \(\tilde{A} = (\mu_A, \nu_A)\) denotes an intuitionistic fuzzy number if \(\mu_A\) and \(\nu_A\) are fuzzy numbers with \(\nu_A \leq \mu_A\), where \(\mu_A^c\) denotes the complement of \(\mu_A\).

Some operations on intuitionistic fuzzy sets are:
\[
\tilde{A} \cap \tilde{B} = \left[\left\{x, \min(\mu_A(x), \mu_B(x)), \max(\nu_A(x), \nu_B(x))\right\} | x \in X\right]\]
\[
\tilde{A} \cup \tilde{B} = \left[\left\{x, \max(\mu_A(x), \mu_B(x)), \min(\nu_A(x), \nu_B(x))\right\} | x \in X\right]$

3. INTUITIONISTIC FUZZY OPTIMIZATION TECHNIQUE
Consider the general optimization problem given as

\[
\text{Max} \quad f_i(x), \quad i = 1, 2, ..., p \\
\text{Such that} \quad g_j(x) \leq 0, \quad j = 1, 2, ..., q, \quad x \geq 0
\]

(4)

Where, \(x\) is decision variables, \(f_i(x)\) denotes objective functions, \(g_j(x)\) denotes the constraint functions, \(p\) and \(q\) respectively denotes the number of objective(s) and constraints. The solution of this crisp model must satisfy all constraints exactly.

In analogous fuzzy optimization model to the above problem, the degree of acceptance of objective(s) and constraints must be maximized respectively:

\[
\text{Min} \quad f_i(x), \quad i = 1, 2, ..., p \\
\text{Such that} \quad g_j(x) \leq 0, \quad j = 1, 2, ..., q, \quad x \geq 0
\]

(5)

Where \(\text{Min}\) denotes fuzzy minimization and \(\leq\) denotes fuzzy inequality. For solution of such system (5), Bellman and Zadeh [5] used fuzzy set maximize the degree of membership (acceptance) of the objective and constraints.
Max $\mu_k(x)$, \hspace{1cm} k = 1, 2, ..., p + q \\
Such that \\
$0 \leq \mu_k(x) \leq 1$, \hspace{1cm} x \geq 0 \hspace{1cm} (6)

Where $\mu_k(x)$ denotes the degree of satisfaction to respective fuzzy sets. As in fuzzy set the degree of non-membership is complement of membership, hence maximization of membership function will automatically minimize the non-membership.

But in intuitionistic fuzzy set degree of rejection is defined simultaneously with the degree of acceptance and when both these degree are not complementary each other, hence IFS may give more general tool for describing this uncertainty based optimization model. Thus, intuitionistic fuzzy optimization (IFO) model for (6) is given as

$$\begin{align*}
\max_x \mu_k(x), & \hspace{1cm} k = 1, 2, ..., p + q \\
\min_x \nu_k(x), & \hspace{1cm} k = 1, 2, ..., p + q \\
\text{Such that} & \\
\nu_k(x) \geq 0, & \hspace{1cm} k = 1, 2, ..., p + q \\
\mu_k(x) \geq \nu_k(x), & \hspace{1cm} k = 1, 2, ..., p + q \\
\mu_k(x) + \nu_k(x) \leq 1 & \\
k = 1, 2, ..., p + q & 
\end{align*}$$

(7)

Where, $\mu_k(x)$ denotes the degree of acceptance of $X$ to the $k^{th}$ IFS and $\nu_k(x)$ denotes the degree of rejection of $X$ from the $k^{th}$ IFS. These IFS include intuitionistic fuzzy objective(s) and constraints.

Now the decision set $\bar{D}$ is defined as conjunction of intuitionistic fuzzy objective(s) and constraints is defined as

$$\bar{D} = \{ (x, \min(\mu_F(x), \mu_C(x)), \max(\nu_F(x), \nu_C(x))) \}$$

(8)

Where $\bar{F}$ is integrated intuitionistic fuzzy objective and $\bar{C}$ denotes integrated intuitionistic fuzzy constraints and is defined as:

$$\bar{F} = \{(x, \mu_F(x), \nu_F(x)) | x \in X \} = \bigcap_{i=1}^{p_i} F_i$$

$$\bar{C} = \{(x, \mu_C(x), \nu_C(x)) | x \in X \} = \bigcap_{i=1}^{q_i} C_i$$

And the intuitionistic fuzzy decision set (IFDS) denoted as $\bar{D}$:

$$\bar{D} = \bar{F} \cap \bar{C} = \{(x, \mu_F(x), \nu_F(x)) | x \in X \}$$

(9)

$$\mu_B(x) = \min(\mu_F(x), \mu_C(x)) = \min_{k=1}^{p+q} \mu_k(x) \hspace{1cm} (10)$$

$$\nu_B(x) = \max(\nu_F(x), \nu_C(x)) = \max_{k=1}^{p+q} \nu_k(x) \hspace{1cm} (11)$$

where $\mu_B(x)$ denotes the degree of acceptance of IFDS and $\nu_B(x)$ denotes the degree of rejection of IFDS.

Further for the feasible solution the degree of acceptance of IFDS always is less than or equal to the degree of acceptance of any objective and constraint and the degree of rejection of IFDS always is more than or equal to the degree of rejection of any objective and constraint, i.e.

$$\mu_B(x) \leq \mu_k(x), \hspace{1cm} k = 1, 2, ..., p + q$$

$$\nu_B(x) \geq \nu_k(x), \hspace{1cm} k = 1, 2, ..., p + q$$

Thus the above system can be transformed to the following system of inequalities:

$$\begin{align*}
\mu_k(x) & \geq \alpha, k = 1, 2, ..., p + q \\
\nu_k(x) & \leq \beta, k = 1, 2, ..., p + q \\
\alpha & \leq \beta \\
\alpha & \geq 0 \\
\beta & \geq 0 \\
x & \in X
\end{align*}$$

(12)

Where $\alpha$ denotes the minimum acceptable degree of objective(s) and constraints, and $\beta$ denotes the maximum degree of rejection of objective(s) and constraints.

Using the IFOP analogous to problem (5) transformed to the linear programming problem can be given as:

$$\begin{align*}
\text{Maximize} \hspace{0.5cm} (\alpha - \beta) \\
\mu_k(x) & \geq \alpha, k = 1, 2, ..., p + q \\
\nu_k(x) & \leq \beta, k = 1, 2, ..., p + q \\
\alpha & \leq 1 \\
\alpha & \geq 0 \\
\beta & \geq 0 \\
x & \in X
\end{align*}$$

(13)

This can be easily solved by simplex method for solution of multi-objective linear programming problem by IFO.

Figure of the membership function and non-membership function for maximization type objective function are shown in figure (1):

4. CROP PRODUCTION PLANNING PROBLEM

Let the number of crop be $n$ and let the decision variables be $x_1, x_2, ..., x_n$, denote the cultivation for the crop 1, 2, ..., $n$ and $P_i$, $c_i$, $l_i$ and $w_i$ be production, profit, investment and labour (time) coefficient for cultivation per unit area for the crop $i$ respectively. Land is limited and hence $x_1 + x_2 + ... + x_n$ is always less than or equal to a fixed number (say $L_i$). Further, let $W$ be total labour (man-day). In order to maximize profit and minimize cost of the agricultural production, the problem is formulated as the multiobjective linear programming problem.
The above multi-objective programming problem can be considered as linear fractional programming with an objective to optimize the efficiency of the system. We considered the optimization of ratio of profit \( z_2 \) with the investment \( z_3 \) as a fractional objective function. Further for the sake of simplicity we assume the ratio as unity and hence the two objective \( z_2 \) and \( z_3 \) are reduced to a single objective \( z_2 - z_3 \).

5. COMPUTATIONAL ALGORITHM

Using the above mentioned theorem and with the method by Anglev [3], we develop the following algorithm for getting solution of a multi objective programming problem in intuitionistic fuzzy environment:

**Step 1:** Take one objective function out of given \( k \) objectives and solve it as a single objective subject to the given constraints. Form obtained solution vectors find the values of remaining \((k - 1)\) objective functions.

**Step 2:** Continue the step 1 for remaining \((k-1)\) objective functions. If all the solutions are same, then one of them is the optimal compromise solution.

**Step 3:** Tabulate the solutions thus obtained in step 1 and step 2 to construct the Positive Ideal Solution (PIS) as given below.

<table>
<thead>
<tr>
<th>( f_1 )</th>
<th>( f_2 )</th>
<th>( f_3 )</th>
<th>...</th>
<th>( f_k )</th>
<th>( X )</th>
</tr>
</thead>
<tbody>
<tr>
<td>max ( f_1 )</td>
<td>( f_1(X_1) )</td>
<td>( f_2(X_2) )</td>
<td>...</td>
<td>( f_k(X_k) )</td>
<td>( X_1 )</td>
</tr>
<tr>
<td>max ( f_2 )</td>
<td>( f_1(X_1) )</td>
<td>( f_2(X_2) )</td>
<td>...</td>
<td>( f_k(X_k) )</td>
<td>( X_2 )</td>
</tr>
<tr>
<td>max ( f_3 )</td>
<td>( f_1(X_1) )</td>
<td>( f_2(X_2) )</td>
<td>...</td>
<td>( f_k(X_k) )</td>
<td>( X_3 )</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>max ( f_k )</td>
<td>( f_1(X_1) )</td>
<td>( f_2(X_2) )</td>
<td>...</td>
<td>( f_k(X_k) )</td>
<td>( X_k )</td>
</tr>
</tbody>
</table>

**Table 1. Positive Ideal Solution**

**Step 4:** From PIS, obtain the lower bounds and upper bounds for each objective functions, where \( f_k^l \) and \( f_k^u \) are the maximum, minimum values respectively.

**Step 5:** Set upper and lower bounds for each objective for degree of acceptance and degree of rejection corresponding to set of solutions obtained in step 4.

For membership functions:

Upper and lower bound for membership functions

\( U_k^u = \max(\tilde{Z}_k(X_k)) \)

\( L_k^u = \min(\tilde{Z}_k(X_k)) \), \( 0 \leq \tau \leq K \)

For non-membership functions:

\( U_k^l = U_k^u - \lambda(U_k^u - L_k^u) \), \( U_k^l = L_k^u, 0 < \lambda < 1 \).

In our problem, we have taken \( \lambda = 0.2 \).

**Step 6:** MOLP problems (1) can be written as:

\[
\begin{align*}
\text{Maximize } & f_1 x_1 + f_2 x_2 + \ldots + f_n x_n \\
\text{Subject to } & \sum_{i=1}^{n} p_i x_i \geq p_e, \quad \text{(Essential crop constraints)} \\
& x_1 + x_2 + \ldots + x_n \leq L, \quad \text{(Land constraint)} \\
& w_1 x_1 + w_2 x_2 + \ldots + w_n x_n \leq W, \quad \text{(Labour constraint)} \\
& x_1, x_2, \ldots, x_n \geq 0.
\end{align*}
\]

Such that

\( f_k(x) \geq g_k^0 \), for every \( k \), where \( g_k^0 \) are aspirations levels given by decision maker. Here all objectives are conflicting nature, and hence here inequalities are taken as intuitionistic fuzzy inequalities.

Further, we define membership and non-membership function for the intuitionistic fuzzy inequalities in next step.

**Step 7:** Construction of membership and non-membership functions

Define the membership and non-membership function for the uncertain objective functions.

(i) For maximization of objective functions

\[
\mu_k(z_k(x)) = \begin{cases} 
1, & z_k(x) \geq u^{acc} \\
\frac{u^{acc} - t^{acc}}{t^{acc}} & \text{if } l^{acc} \leq z_k(x) < u^{acc} \\
0, & z_k(x) \leq l^{acc}
\end{cases}
\]

\[
u_k(z_k(x)) = \begin{cases} 
0, & z_k(x) \geq u^{rej} \\
\frac{u^{rej} - t^{rej}}{t^{rej}} & \text{if } l^{rej} < z_k(x) < u^{rej} \\
1, & z_k(x) \leq l^{rej}
\end{cases}
\]

(ii) For minimization of objective functions

\[
\mu_k(z_k(x)) = \begin{cases} 
0, & z_k(x) \geq u^{acc} \\
\frac{u^{acc} - z_k(x)}{u^{acc} - l^{acc}} & \text{if } l^{acc} < z_k(x) < u^{acc} \\
1, & z_k(x) \leq l^{acc}
\end{cases}
\]

\[
\nu_k(z_k(x)) = \begin{cases} 
1, & z_k(x) \geq u^{rej} \\
\frac{u^{rej} - z_k(x)}{u^{rej} - l^{rej}} & \text{if } l^{rej} < z_k(x) < u^{rej} \\
0, & z_k(x) \leq l^{rej}
\end{cases}
\]

(iii) Define the membership and non-membership function for the uncertain constraints (\( \leq \text{inc} \)).

\[
\mu_i(A(x)) = \begin{cases} 
1, & A(x) \leq b_i \\
\frac{t^{acc} + b_i - A(x)}{t^{acc}} & \text{if } b_i < A(x) < b_i + t^{acc} \\
0, & A(x) \geq b_i + t^{acc}
\end{cases}
\]

\[
u_i(A(x)) = \begin{cases} 
0, & A(x) \leq b_i + t^{rej} \\
\frac{A(x) - (b_i + t^{rej})}{(t^{rej})} & \text{if } b_i < A(x) < b_i + t^{rej} \\
1, & A(x) \geq b_i + t^{rej}
\end{cases}
\]

(iv) Define the membership and non-membership function for the uncertain constraints (\( \geq \text{inc} \)).

\[
\mu_i(A(x)) = \begin{cases} 
1, & A(x) \geq b_i \\
\frac{A(x) - (b_i - t^{inc})}{t^{inc}} & \text{if } b_i - t^{inc} < A(x) < b_i \\
0, & A(x) \leq b_i - t^{inc}
\end{cases}
\]

\[
u_i(A(x)) = \begin{cases} 
0, & A(x) \leq b_i - t^{rej} \\
\frac{A(x) - (b_i - t^{rej})}{(t^{rej})} & \text{if } b_i - t^{rej} < A(x) < b_i - t^{rej} \\
1, & A(x) \geq b_i - t^{rej}
\end{cases}
\]
Where $t_{i}^{acc}, \ t_{i}^{ref} = \delta t_{i}^{acc}, \ 0 < \delta < 1$ are tolerances for membership and non-membership function respectively. In our problem, we have taken $\delta = 0.1$.

**Step 8:** In this step we apply intuitionistic fuzzy optimization technique for MOLPP problem and get an equivalent linear programming problem as

$$\begin{align*}
\text{Maximize} \ (\alpha - \beta) \\
\mu_{k}(x) \geq \alpha, k = 1, 2, ..., p + q \\
\nu_{k}(x) \leq \beta, k = 1, 2, ..., p + q \\
\alpha + \beta \leq 1 \\
\alpha \geq \beta \\
\beta \geq 0 \\
x \in X
\end{align*}$$

(15)

**6. ILLUSTRATION OF THE PROBLEM:**

Consider a crop planning problem where a farmer can grow rice, til, urd crops in kharif season and can grow wheat, maize, pulse, potato, tilhan in rabi season. The land available is 1.35 acre with given labour hour constraint. Being a smallholder farmer he need at least 4.42 quintal of rice and 3.42 quintal of wheat necessarily to meet his annual foodgrains requirement as his basic need. Now the problem of the farmer is to plan a suitable crop combination model for each season of rabi and kharif for his land to get maximum profit. And aspiration levels of rupees 78,000 is set to meet his other annual family requirement.

The labour availability for each season is given to be 210 man-days. Productivity (quintal per acre), labour requirement, investment, for various crops are placed in Table 2. The objective of the problem are to maximize the profit and minimize the investment and to provide his minimum foodgrain requirement. The computational algorithms developed in section 5 are being implemented step by step to find an optimal solution of the above farmer crop modelling problem.

**Table 2.**

Maximize $z_1 = 19.64x_1 + 11.56x_2 + 6.56x_3 + 28.07x_4 + 15.44x_5 + 7.82x_6 + 345x_7 + 12.30x_8$ (Production)

Maximize $z_2 = 16512x_1 + 29426.00x_2 + 17249.00x_3 + 17504.83x_4 + 14856.62x_5 + 15354.00x_6 + 51054.00x_7 + 27124.80x_8$ (Profit)

Minimize $z_3 = 17504.83x_1 + 14856.62x_2 + 15354.00x_3 + 51054.00x_4 + 27124.80x_5 + 4832.06x_6 + 6872.62x_7 + 4832.06x_8$ (Expanditure)

**Food requirement constraints**

$19.64x_1 \geq 4.42$

$28.07x_4 \geq 3.2$

**Labour constraints**

$310x_1 + 75x_2 + 60x_3 \leq 210$

$190x_4 + 265x_5 + 70x_6 + 110x_7 + 80x_8 \leq 210$

**Land constraints**

$x_1 + x_2 + x_3 \leq 1.35$

$x_4 + x_5 + x_6 + x_7 + x_8 \leq 1.35$

$x_j \geq 0, \ j = 1, 2, ..., 8.$

Using fractional programming approach mentioned in section 4, we have converted two objectives $(z_2)$ and $(z_3)$ into one objective as$f_2(x) = z_2(x)$ and we have written $f_1(x) = z_1(x)$. Thus the problem (16) is reduced to the following fractional programming problem.

Maximize $f_1 = 19.64x_1 + 11.56x_2 + 6.56x_3 + 28.07x_4 + 15.44x_5 + 7.82x_6 + 345x_7 + 12.30x_8$

Maximize $f_2 = 10865x_1 + 24793.79x_2 + 14938.34x_3 + 14478.43x_4 + 10356.1x_5 + 12813.24x_6 + 44181.4x_7 + 22292.74x_8$

Such that

$19.64x_1 \geq 4.42$

$28.07x_4 \geq 3.2$

$310x_1 + 75x_2 + 60x_3 \leq 210$

$190x_4 + 265x_5 + 70x_6 + 110x_7 + 80x_8 \leq 210$

$x_1 + x_2 + x_3 \leq 1.35$

$x_4 + x_5 + x_6 + x_7 + x_8 \leq 1.35$

$10865x_1 + 24793.79x_2 + 14938.34x_3 + 14478.43x_4 + 10356.1x_5 + 12813.24x_6 + 44181.4x_7 + 22292.74x_8 \geq 0,$

$x_j \geq 0, \ j = 1, 2, ..., 8.$

In view of realistic modelling of the above crop planning problem, we consider the inequalities $(\geq \text{int})$ as intuitionistic fuzzy inequalities. The reason for such consideration is quite obvious as the various parameters used in the model such as production, labour, prices and other inputs are in general uncertain. Further the production of a crop also depends on many others parameters which are not considered in the model. Now the above MOLPP becomes:
Find $x$
Such that
\begin{align*}
19.64x_1 + 11.56x_2 + 6.56x_3 + \\
28.07x_4 + 15.44x_5 + 7.82x_6 + 345x_7 + \\
12.30x_9 \geq_{\text{int}} 448.9654
\end{align*}
\begin{align*}
10865x_1 + 24793.79x_2 + 14938.24x_4 + \\
14478.43x_3 + 10356.1x_5 + 12813.24x_6 + \\
44181.4x_7 + 22292.74x_8 \geq_{\text{int}} 86596
\end{align*}
\begin{align*}
9.64x_1 \geq_{\text{int}} 4.42 \\
28.07x_4 \geq_{\text{int}} 3.2
\end{align*}
\begin{align*}
310x_1 + 75x_2 + 60x_3 \leq_{\text{int}} 210 \\
190x_4 + 265x_5 + 70x_6 + 110x_7 + 80x_9 \leq_{\text{int}} 210 \\
x_1 + x_2 + x_3 \leq 1.35 \\
x_4 + x_5 + x_6 + x_7 + x_8 \leq 1.35 \\
10865x_1 + 24793.79x_2 + 14938.24x_4 + \\
14478.43x_3 + 10356.1x_5 + 12813.24x_6 + \\
44181.4x_7 + 22292.74x_8 \geq 0, \\
x_j \geq 0, \ j = 1, 2, ..., 8.
\end{align*}

The above problem (18) have been transformed to a linear programming problem using step (7) and (8) of computational algorithms presented in section and the resulting linear programming problem has been solved using Matlab. The results for the optimal crop planning model for area of different crops (in acre) is as follows:

\begin{align*}
\text{area for rice in kharif} & : x_4 = 0.3056 \\
\text{area for til in kharif} & : x_2 = 1.0444 \\
\text{area for urd in kharif} & : x_3 = 0.0000 \\
\text{area for wheat in kharif} & : x_6 = 0.1114 \\
\text{area for maize in rabi} & : x_5 = 0.0000 \\
\text{area for pulses in rabi} & : x_8 = 0.0000 \\
\text{area for potato in rabi} & : x_7 = 1.2386 \\
\text{area for tilhan in rabi} & : x_9 = 0.0000 \\
\text{Degree of acceptance} & : \alpha = 0.7704 \\
\text{Degree of rejection} & : \beta = 0.1440.
\end{align*}

The values obtained for the maximal objective functions are given in table 3.

<table>

</table>

7. CONCLUSION
Here, we have considered objective functions and constraints as intuitionistic fuzzy inequalities to model the farmers crop planning problems in realistic situations as the production or profit cannot be set as crisp inequalities due to imprecision in parameters. Thus MOLP problems become IFMOLP problem in a natural way. We have applied intuitionistic fuzzy approach to convert a IFMOLP problem into crisp linear programming problem using developed algorithms. The developed algorithm has been implemented to obtain an optimal crop production model. The results obtained by developed method are interesting as it satisfy the constraints and achieve the set goals in an optimal way by utilizing maximum land area available with the farmer. Further, the developed model provides more profit to farmer to a tune of Rs. 10,096.14 to farmer aspiration level of Rs. 78,000. Thus the proposed method can be used for handling the crop modeling problems in an effective way.
