#### Abstract

Vehicle speed estimation is very important dimension for observing speed limitation law and observing traffic conditions within city. This document aims to present a new approach for finding speed of vehicle by using Centroid method technique. In this study, the captured traffic images are collected from a stationary camera mounted on a freeway or at the junctions. These images are used for calculating speed for a particular vehicle by calculating Centroid value of vehicle. Using Centroid value, distance traveled by vehicle is calculated. After finding distance covered by vehicle in specific time duration, speed of vehicle is calculated.

This approach is implemented in MATLAB by using image processing functions. Estimating speed of vehicle in traffic surveillance helps in preventing accidental cases, congestion control at junction and marinating traffic discipline within city.

## General Terms

Digital Signal Processing toolbox, Computer vision System toolbox, Speed Estimation, CCTV

## Keywords

Vehicle speed estimation, Centroid Method, MATLAB, Congestion, Traffic

## 1. INTRODUCTION

People encounter more problems as road traffic becomes congested. Congestion is mainly due to less level of road capacity and inbuilt infrastructure. Due to congestion, many accidental problems occur. To reduce or minimize these problems, new approach has been developed for finding vehicle speed. Estimating vehicles speed helps in preventing these problems.

In this document an approach is developed for finding speed of vehicle using centroid method. In this study, the captured traffic images are collected from a stationary camera installed at freeway or junctions. The image taken from camera is converted into gray scale image. This gray scale image is divided into blocks. Same sized blocks are extracted from every succeeding column as well as from every succeeding row. The size of block should be similar to the size of template image. The template image is the image of vehicles which is matched with vehicle of input image to compute the centroid value of vehicle. Centroid of vehicle is calculated two times. Firstly, when vehicle is at one position say position A and after traversing distance, vehicle reaches at new position say position B. Centroid value has been calculated at both the positions. From these centroid values of vehicle, distance traversed by vehicle has been calculated using
distance formula. System time of camera is used to compute the duration in which vehicle cover the about distance.

## 2. LITERATURE SURVEY

Rad A. G. et al. [1] presented a system by using video and image processing toolbox for calculating the speed of vehicle. Image has been taken from camera and camera was calibrated on geometrical equation. The result has average error of speed was $+7 \mathrm{~km} / \mathrm{h}$ and $-7 \mathrm{~km} / \mathrm{h}$. this system is operated on different resolution images and video sequences.
Shedbalkar K. et al. [2] described a speed estimation technique based on extended kalman filter for permanent magnet synchronous. System is developed for estimating speed of motor. System is developed in MATLAB in SIMULINK model Blockset.
Leite A.V. et al. [3] proposed an approach for robust estimation of speed in induction motor sensor less control. Speed estimation method is based on extended kalman filter. This algorithm used reduce order state space model.
Kassen N. et al. [4] developed a reliable and strong vehicle speed estimation technique. This system guides the driver for driving condition and helps to avoid join traffic jam. This approach is based on RF. This system gives accuracy of $100 \%$ for speed estimation and with accuracy of $90 \%$ in typical streets.
Madasu V. K. et al. [5] presented a method for speed estimation of vehicle by tracking vehicles motion. The motion is tracked by using mathematical equation based on spherical projection. Motion tracking has been done using algorithm.
Rahim H. A. et al. [6] estimated the vehicle velocity with the help of laser speed traps and Doppler radars. This method contains several steps image processing, centroid extraction and then tracking.
Barnwal S. et al. [7] developed a system for estimation of speed. This system is developed on the phenomenon of Doppler shift and the time at which vehicle come closest to the point of approach. The approach uses technique named seam carrying.

## 3. TECHNIQUE USED

The core technique used in finding the speed of vehicle is centroid method. In this method, centroid value of vehicle has been calculated when it is at position A. After traversing distance, when vehicle reaches at position $B$ again find the centroid value of vehicle. Two centroid values of vehicle have been calculated at two different positions. From these values, distance has been calculated from which speed is derived in meter per second.

For calculation of centroid value, area of vehicle is calculated by using formula:

$$
\mathrm{A}=\frac{1}{2} \sum_{i=0}^{N-1}\left(x_{i} y_{i+1}-x_{i+1} y_{i}\right)
$$

This formula is used for the calculation of area of polygon. After calculation of area, centroid for particular polygon has been calculated by using formula:

$$
\begin{aligned}
& c_{x}=\frac{1}{6 A} \sum_{i=0}^{N-1}\left(x_{i}+x_{i+1}\right)\left(x_{i} y_{i+1}-x_{i+1} y_{i}\right) \\
& c_{y}=\frac{1}{6 A} \sum_{i=0}^{N-1}\left(y_{i}+y_{i+1}\right)\left(x_{i} y_{i+1}-x_{i+1} y_{i}\right)
\end{aligned}
$$

After calculating centroid value at two position of vehicle, distance traversed by vehicle is calculated by using the distance formula:

$$
\mathrm{D}=\sqrt{\left(x_{2}-x_{1}\right)^{2}+\left(y_{2}-y_{1}\right)^{2}}
$$

Speed is calculated by mathematical formula as given below:

$$
\text { Speed }=\frac{\text { Distance }}{\text { Time }}
$$

## 4. PROPOSED METHODOLOGY

The methodology used is shown in flowchart. The basic approach used is calculating centroid value from which distance has been estimated and speed of vehicle has been calculated.

Figure 1: Flowchart

## 5. EXPERIMENT 1

This experiment has been done on real time images.

## Step 1: Image from camera

Images captured from CCTV camera, installed at junction or freeway has been used as input image. Input image is shown in figure 2

Figure 2: Input Image

## Step 2: Read Template Image

Images of individual vehicle are stored in database. From database, read template images of vehicle. For Experiment template is shown in figure 3.

Figure 3: Template image

## Step 3: Convert into Gray Scale

Both the input image and template image has been converted into gray scale images. Gray scale images give better result on comparison. Gray scale images are shown in figure 4 and 5 .

Figure 4: Gray Scale image of input image

Figure 5: Gray Scale image of Template image

## Step 4: Dividing into blocks

Input image is divided into blocks. Same sized blocks are extracted from every succeeding column as well as from every succeeding row. Each block has size similar to the template image.

## Step 5: Matching of blocks

Template image is matched with each individual block. Matching has been done by using co-relation function with matching factor as .9 . If both matched, information about matched block has been retrieved.

Step 6: Compute coordinates value of matched block
After matching of block, coordinates value of matched block has been calculated. Block is in rectangular shape so that four coordinates has been calculated. First and second coordinates have been calculated by finding the starting and ending coordinate of block in first row. Next two coordinates have been calculated by adding the size of block to that coordinates.

TABLE I. CO-ORDINATE VALUES

| Coordinates | Values | Coordinates | Values |
| :---: | :---: | :---: | :---: |
| $\mathbf{X 1}$ | 150 | Y1 | 9 |
| $\mathbf{X 2}$ | 182 | $\mathbf{Y 2}$ | 9 |
| $\mathbf{X 3}$ | 182 | $\mathbf{Y 3}$ | 40 |
| $\mathbf{X 4}$ | 150 | $\mathbf{Y 4}$ | 40 |

Step 7: Compute centroid value
Centroid value of matched block has been calculated. Before calculating centroid value, area of block has been calculated. Area is calculated by using formula:

$$
\mathrm{A}=\frac{1}{2} \sum_{i=0}^{N-1}\left(x_{i} y_{i+1}-x_{i+1} y_{i}\right)
$$

After calculating area, centroid value along $x$-axis and $y$-axis has been calculated using following formula.

$$
\begin{aligned}
& c_{x}=\frac{1}{6 A} \sum_{i=0}^{N-1}\left(x_{i}+x_{i+1}\right)\left(x_{i} y_{i+1}-x_{i+1} y_{i}\right) \\
& c_{y}=\frac{1}{6 A} \sum_{i=0}^{N-1}\left(y_{i}+y_{i+1}\right)\left(x_{i} y_{i+1}-x_{i+1} y_{i}\right)
\end{aligned}
$$

TABLE II. Centroid Value

| Extent | Centroid value |
| :--- | :---: |
| $\boldsymbol{c}_{\boldsymbol{x}}$ | 166 |
| $\boldsymbol{c}_{\boldsymbol{y}}$ | 24.5 |

Step 8: Read vehicle image after traveling distance
After traveling distance, vehicle image has been taken from camera. Image is shown in figure 6.

Figure 6: Vehicle after traveling distance

## Step 9: Converted into Gray scale

Image has been converted into gray scale for comparison. Image has been divided into blocks. Again blocks are matched with template image and information about most matched block has been retrieved.

Figure 7: Gray scale image of figure 6.
Step 10: Compute coordinates value of matched block After traveling distance, coordinates value for matched blocks have been calculated. Coordinates value is calculated as step no 6.

TABLE III. Co-Ordinate Values

| Coordinates | Values | Coordinates | Values |
| :---: | :---: | :---: | :---: |
| $\mathbf{X 1}$ | 154 | $\mathbf{Y 1}$ | 69 |
| $\mathbf{X 2}$ | 186 | $\mathbf{Y 2}$ | 69 |
| $\mathbf{X 3}$ | 186 | $\mathbf{Y 3}$ | 100 |
| $\mathbf{X 4}$ | 154 | $\mathbf{Y 4}$ | 100 |

Step 11: Compute centroid value
Centroid value has been calculated similarly as step no 7 . Initially, area has been calculated for block then centroid value has been calculated.

TABLE IV. Centroid Value

| Extent | Centroid value |
| :---: | :---: |
| $\boldsymbol{c}_{\boldsymbol{x}}$ | 170 |
| $\boldsymbol{c}_{\boldsymbol{y}}$ | 84.5 |

Step 12: Calculating distance
Distance traveled by vehicle in horizontal or vertical direction, calculated by using distance formula. This formula has been applied on centroid coordinates for two most matched blocks with template image. Distance formula is given by:

$$
\mathrm{D}=\sqrt{\left(x_{2}-x_{1}\right)^{2}+\left(y_{2}-y_{1}\right)^{2}}
$$

## Step 13: Notify time from CCTV camera

Time taken by vehicle to travel distance is notified from CCTV camera.

## Step 14: Calculating speed of vehicle

Speed of vehicle has been estimated by distance traveled by vehicle in particular instant of time. Speed is calculated by using mathematical concept of speed, time and distance. It is given by:

$$
\text { Speed }=\frac{\text { Distance }}{\text { Time }}
$$

## 9. RESULT

The result of estimation of vehicle speed using centroid method is shown in table 17 .Four real time images are experimented and results are notified according to accuracy in percentage.

TABLE XVII. Centroid Value

| Experiments | Distance <br> $($ meters $)$ | Speed <br> $(\mathrm{m} / \mathrm{s})$ |
| :---: | :---: | :---: |
| Experiment 1 | 60.133 | 2.7333 |
| Experiment 2 | 50.245 | 2.3748 |
| Experiment 3 | 43.6183 | 1.9826 |
| Experiment 4 | 236.02 | 1.966 |
| Accuracy \% | 100 | 99.01 |

## 10. CONCLUSION

An efficient image processing approach has been suggested and analyzed for estimation of speed of vehicle using centroid method. From analysis, conclude that images in which vehicle travel in vertical direction gives result with accuracy $98 \%$ to $99 \%$. The reason behind this is vehicle coming from far distance looks in small size but as it covers distance in vertical direction size of vehicle increases, two template images are needed for matching of vehicle and accuracy decreases. The images in which vehicle moving in horizontal direction, size of vehicle remains constant and accuracy is almost $100 \%$.

## 11. FUTURE SCOPE

Many of the system have been developed till date but no one is best suitable according to efficiency, reliability and accuracy. The above developed system can be extended on SIMULINK Blockset in MATLAB and simulated for better efficiency and accuracy. After implementing on SIMULINK Blockset, it can be implemented on hardware using HDL code generation in MATLAB.
