#### Abstract

In this paper, we proposed a model for text encryption using elliptic curve cryptography (ECC) for secure transmission of text and by incorporating the Arithmetic/Huffman data compression technique for effective utilization of channel bandwidth and enhancing the security. In this model, every character of text message is transformed into the elliptic curve points ( $\mathrm{X}_{\mathrm{m}}, \mathrm{Y}_{\mathrm{m}}$ ), these elliptic curve points are converted into cipher text .The resulting size of cipher text becomes four times of the original text. For minimizing the channel bandwidth requirements, the encrypted text is compressed using the Arithmetic and Huffman compression technique in the following two ways by considering i) x - y coordinates of encrypted text and ii) x-co-ordinates of the encrypted text. The results of the above two cases are compared in terms of overall bandwidth required and saved for Arithmetic and Huffman compression.

## Keywords

Elliptic Curve Cryptography (ECC), Text encryption, Huffman compression, Arithmetic compression

## 1. INTRODUCTION

Over last three decades, the traditional cryptosystem like DES, DLP, AES, DSA and RSA etc. are used for privacy and security. But these conventional methods are not able to support the new generation of digital communication and information access devices, these devices required a crypto-security technology. A method called Elliptic Curve Cryptography is becoming the choice for mobile communication. Elliptic curve cipher use very small key size and computationally is very efficient. N. Koblitz [1] and Victor Miller [2], independently proposed the elliptic curve cryptosystem.

One can use an elliptic curve group that is smaller in size while maintaining the same level of security. The result is smaller key sizes, bandwidth savings, and faster implementations-features that are especially attractive for security applications where computational power and integrated circuit space is limited, such as smart cards, personal digital assistants, and wireless devices. Elliptic curve cryptographic protocols for digital signatures, public-key encryption, and key establishment have
been standardized by numerous standards organizations including:

- American National Standards Institute (ANSI X9.62 [3], ANSI X9.63 [4])
- Institute of Electrical and Electronics Engineers (IEEE 1363-2000 [5])
- International Standards Organization (ISO/IEC 159463 [6])
- U.S. government's National Institute for Standards and Technology (FIPS 186-2 [7])
- Internet Engineering Task Force (IETF PKIX [7], IETF OAKLEY [8])
- Standards for Efficient Cryptography Group (SECG [9])

The vast majority of the products and standards that use publickey cryptography for encryption and digital signatures use RSA [10]. As we have seen, the bit length for secure RSA use has increased over recent years, and this has put a heavier processing load on applications using RSA. This burden has ramifications, especially for electronic commerce sites that conduct large numbers of secure transactions. Recently, a competing system that has emerged is elliptic curve cryptosystem (ECC) $[4,11]$.

### 1.1 Elliptic Curve Cryptography

Elliptic curve cryptography makes use of elliptic curves in which the variables and coefficients are all restricted to elements of a finite field. Two families of elliptic curves are used in cryptographic applications: Prime curves defined over $Z_{p}$ and binary curves constructed over GF $\left(2^{\mathrm{m}}\right)$. Fernandez[12] points out that prime curves are best suited for software applications, as the extended bit -fiddling operations needed by binary curves are not required; , and that binary curves are best for hardware applications, where it takes remarkably few logic gates to create a powerful and fast cryptosystem. In this paper we used prime curves defined over $\mathrm{Z}_{\mathrm{p}}$ for analysis purpose.

### 1.2Mathematical review

We consider an elliptic curve over prime fields which are of the form:
$E: y^{2}=x^{3}+a x+b \bmod p$ where $a, b \in \mathrm{~F} p$ and $4 a^{3}+27 b^{2} \neq 0$ $\bmod p$

The addition of two points $P\left(x_{1}, y_{1}\right)$ and $Q\left(x_{2}, y_{2}\right)$ is calculated by:

$$
\begin{aligned}
& R\left(x_{3}, y_{3}\right)=P+Q \text { where: } \\
& x_{3}=\lambda^{2}-x_{1}-x_{2}, \\
& y_{3}=\lambda\left(x_{1}-x_{3}\right)-y_{1}, \\
& \lambda=\left(y_{2}-y_{1}\right) /\left(x_{2}-x_{1}\right) \text { if } P \neq Q \\
& \lambda=\left(3 x_{1}^{2}+a\right) / 2 y_{1} \text { if } P=Q
\end{aligned}
$$

## 2. DATA COMPRESSION TECHNIQUES

Compression is a technology for reducing the quantity of data used to represent any content without excessively reducing the quality of the picture. It also reduces the number of bits required to store and/or transmit digital media. Compression is a technique that makes storing easier for large amount of data. The performance of data compression algorithms is measured in terms of compression ratio (CR) which is defined as

## Compression ratio $=$ Size of the output stream/size of the input

 stream.We analyzed the adoptability of Huffman data compression techniques for encrypted image data/message in the context of ECC for effective utilization of channel bandwidth for two cases i.e. (i) For different sizes of same image and (ii) For different images of almost same size.

### 2.1 Arithmetic Coding Technique for Data Compression

Due to its high efficiency and the hardware implementation of Arithmetic coding gains more interest. The basic concept of arithmetic coding can be traced back to Elias in the early 1960s (see [13],pp. 61-621). Practical techniques were first introduced by Rissanen [14] and Pasco [15], and developed further by Rissanen [16]. The reader interested in the broader class of arithmetic codes is referred to [17]; a tutorial is available in [18].

Arithmetic coding is superior in most respects to the betterknown Huffman [13] method. In comparison of the Huffman coding algorithm, Arithmetic Coding over comes the constraint that the symbol to be encoded by a whole number of bits. This leads to higher efficiency and a better comparison ratio in general. Indeed Arithmetic coding can be proven to almost reach the best comparison ratio possible, which is bounded by the entropy of the data being encoded. Though during the encoding the algorithm generates one code for the whole input stream, this is done in a fully sequential manner, symbol after symbol.

## Huffman Compression Technique

In 1952, Huffman [13] proposed an elegant sequential algorithm which generates optimal prefix codes in O (nlogn) time. The algorithm actually needs only linear time provided that the frequencies of appearances are sorted in advance [20, 21]. Since then there have been extensive researches on analysis, implementation issues and improvements of the Huffman coding theory in a variety of applications [22, 23, 24, 25, 26, 27and 28].

Huffman coding, is a particular method of compressing data through the use of a code table with encodings of variable lengths. A Huffman code is an optimum, or minimumredundancy, code, which means that messages which occur with greater probability have shorter encodings; in addition, it is prefix free, meaning that no code in the table may be the
beginning part of any other code. Huffman describes an algorithm which can be used to generate a binary Huffman code from a collection of messages, or strings, ordered by probability. To generate a code, one starts with a collection of all messages in order of probability. The two least probable messages are removed from the collection and combined into a "composite message," with probability equal to the sum of the messages comprising it. This process is repeated until there is only a single composite message left in the collection, with a probability of 1 ; that composite message represents the entire Huffman code. This is easily converted to a tree-based approach, in which the initial messages are represented as leaf nodes, each edge represents a digit 0 or 1 in the encoding, and "composite messages" are sub trees created by assigning a common parent to the merged messages.

## 3. PROPOSED MODEL FOR ENCRYPTION AND DECRYPTION

The proposed model at sender and receiver side for text in the context of ECC for enhancing the security and effective utilization of the channel bandwidth is shown in Figure1.The following two sections describes the proposed model at sender side and at receiver side of text encryption and compression technique for secure transmission of the text by aiming the effective utilization of channel bandwidth.

### 3.1Encryption and Compression procedure (at sender side)

1. Take plain text $X$,
2. Each character of $X$, i.e. assigned as message $P_{m}$, can be converted into the point coordinate ( $\mathrm{X}_{\mathrm{m}}, \mathrm{Y}_{\mathrm{m}}$ ) on EC
3. Encryption/decryption system require a point on $G$ and an elliptic group $\mathrm{E}_{\mathrm{p}}(\mathrm{a}, \mathrm{b})$. User A select a private key $\mathrm{n}_{\mathrm{A}}$ and generate a public key $P_{A}=n_{A} \times G$. To encrypt and send pixel $P_{m}$, to B , A choose a random positive integer k and produce the cipher text $\mathrm{C}_{\mathrm{m}}$ consisting of the pair of points
$C_{m}=\left\{k G, P_{m}+k P_{B}\right\}-(1)$, where $P_{B}$ is the public key of user B.
4. The x -coordinates/( $\mathrm{x}, \mathrm{y}$ ) coordinates of encrypted cipher text values are compressed by using the Arithmetic/Huffman data compression which is then transmitted through in secure channel to the destination.

### 3.1Proposed Decompression and Decryption (at the receiver side)

1. Received raw data, i.e. compressed x-coordinates/ (x,y) coordinates of the encrypted text is decompressed using the Arithmetic/Huffman decompression technique
2. To retrieve the cipher text values (if the raw data contains only $x$ coordinates), one need to compute $y$-coordinates also. These values are generated by substituting the x co-ordinate values into the chosen elliptic curve
3. To decrypt the cipher pixel, B multiplies the first point in the pair by B's secret key and subtracts the result from the second point:

$$
\begin{equation*}
\mathrm{P}_{\mathrm{m}}+\mathrm{kP}_{\mathrm{B}}-\mathrm{n}_{\mathrm{B}}(\mathrm{kG})=\mathrm{P}_{\mathrm{m}}+\mathrm{k}\left(\mathrm{n}_{\mathrm{B}} \mathrm{G}\right)-\mathrm{n}_{\mathrm{B}}(\mathrm{kG})=\mathrm{P}_{\mathrm{m}} \tag{2}
\end{equation*}
$$

Figure 1 Proposed model at sender side and receiver side for images in the context of ECC

For practical purpose, We have taken an elliptic curve $\mathrm{E}_{571}(1,1)$ in the prime field and the alpha numerical characters are mapped $[29,30]$ to the points of the EC. The mapped points are encrypted [31, 32] and computed compression ratio [33] for encrypted points using Huffman, from which we found the overall percentage of the bandwidth required and the percentage of the bandwidth saved.

The following rules are implemented for reducing the bandwidth:

1. The size of encrypted data size is $n *\left[K G, P_{m}+K P_{B}\right]$ for the n bytes of the message. If, we send all encrypted data as it is to the destination, then the bandwidth required is $4 *_{\mathrm{n}}$ bytes for n byte data message/image, i.e., Four times of the bandwidth required.
2. Instead of sending every point $\mathrm{C}_{\mathrm{m}}$ we send only once $K G$ and rest of the $\left[\mathrm{P}_{\mathrm{m}}+K \mathrm{P}_{\mathrm{B}}\right]$ for n times, i.e., for 4 n bytes of encrypted data we send only KG+n*[ $P_{m}+$ $\mathrm{KP}_{\mathrm{B}}$ ] bytes to the destination, which is enough to recover the original Message. The amount of bandwidth saved at this stage is:
If the n value is very large, then, $\mathrm{KG}+\mathrm{n}\left(\mathrm{P}_{\mathrm{m}}+\mathrm{KP}_{\mathrm{B}}\right) \approx$ $\mathrm{n}\left(\mathrm{P}_{\mathrm{m}}+K \mathrm{P}_{\mathrm{B}}\right)$, hence the reduced bandwidth is give by,
$\frac{n\left[P_{m}+K P_{B}\right]}{n\left[K G\left(P_{m}+K P_{B}\right)\right]}=\frac{P_{m}+K P_{B}}{K G\left(P_{m}+K P_{B}\right)}$
As we know $K G$ and $P_{m}+K P_{B}$ are 1 byte each, so that bandwidth saved to $1 / 2$ of the originally required, i.e., $50 \%$ can be saved at this point.
3. As $n$ is very large the encrypted data of $\left[K G, n *\left(P_{m}+\right.\right.$ $\left.\mathrm{KP}_{\mathrm{B}}\right)$ ] will become $\approx \mathrm{n}\left(\mathrm{P}_{\mathrm{m}}+\mathrm{KP}_{\mathrm{B}}\right), C_{m}$ is compressed using Huffman Compression by considering the following two cases
(i) Both (x, y) co-ordinates of the encrypted data of $\left[K G+n *\left(P_{m}+K P_{B}\right)\right]$ is compressed using Arithmetic/ Huffman compression and the results are shown in the corresponding tables and graphs [Table 4.1 to Table 4.4 and Figures 4.1 to Figures 4.2]. In this case, the amount of bandwidth saved is $50 \%$ of original encrypted data + reduced size of the compressed data. Hence,

$$
O B W S \%=\frac{0.5 * O E D S+C B \text { in }(x, y)}{O E D S} * 100
$$

*OEDS-Original encrypted data Size,
*CB-Compression Bits

The overall percentage of the overall bandwidth required (OBWR) can be calculated by the equation

## OBWR\%=100-OBWS\%

(ii) In this case, only $x$ coordinates of encrypted data of $\left[K G+n *\left(P_{m}+K P_{B}\right)\right]$ is taken for compression, as we know the x -co-ordinate of the ECC, we can get the corresponding y co-ordinate by using the following cubic equation,

$$
y^{2} \equiv x^{3}+a x+b \bmod p
$$

If we take only $x$ co-ordinate of the original encrypted data, then the amount of bandwidth saved is $75 \%$ of original encrypted data + reduced size of the compressed data. Hence, the percentage of the bandwidth saving (OBWS) can be calculated by the equation

$$
O B W S \%=\frac{0.75 * O E D S+C B \text { in }(x, y)}{O E D S} * 100
$$

The overall percentage of the bandwidth required (OBWR) can be calculated by the equation

## OBWR\%=100-OBWS\%

For this data, we computed the bandwidth required and saved by applying Arithmetic and Huffman compression. The results are shown in tables and graphs.

At the destination the data is uncompressed and original text is recovered by using the equation (2).

## 4. ARITHMETIC COMPRESSION

The following experiments are conducted by considering only x coordinates and both ( $x, y$ ) Coordinates of the encrypted text for computing compression ratio, overall percentage of bandwidth requirement, and saving for the following three cases.

### 4.1For ( $x, y$ ) Coordinates of the Encrypted Text

This section presents the compression and compression ratio for three different cases

Table 1: Arithmetic Compression for Case (i)

| Sl. <br> No. | Input String |  |  | (x,y) | Arithmetic |  |

Figure 6: Overall BWR\% for Case (i),(ii) \& (iii)

Figure 7 Overall BWS\% for Case (i), (ii) \& (iii)
One can observe the following variation range in the overall BWR\% and BWS\% from above Tables 10 to 12, Figures 6 and Figure 7 as follows.

| Cases | OBWR\% Range | OBWS\% Range |
| :---: | :---: | :---: |
| Case(i) | $8.75-12.75$ | $87.25-91.25$ |
| Case(ii) | $8.75-12.84$ | $87.15-91.25$ |
| Case(iii) | $1.04-9.94$ | $90.05-98.95$ |

## 5. HUFFMAN COMPRESSION:

The following experiments are conducted by considering only $x$ coordinates and both ( $\mathrm{X}, \mathrm{Y}$ ) Coordinates of the encrypted text for computing compression ratio, the overall percentage of bandwidth required and saved for the following three cases.

### 5.1For ( $x, y$ ) Coordinates of the Encrypted Text:

This section gives the overall percentage of bandwidth requirement and saved for above three cases by considering the both ( $\mathrm{x}, \mathrm{y}$ ) co-ordinates of the encrypted data

Table 13: Huffman Compression for Case (i)

| Sl. <br> No. | Input String |  |  |  | Huffman |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |

Figure 14 : Overall BWR\% for Case (i), (ii) \& (iii)

Figure 15: Overall BWS\% for Case (i), (ii) \& (iii)
One can observe the following variation range in the overall BWR \% and BWS\% from the above Tables 22 to 24 and Figures 14 and Figure 15 as follows.

| Cases | OBWR\% Range | OBWS\% Range |
| :---: | :---: | :---: |
| Case(i) | $9.375-13.94$ | $86.05-90.625$ |
| Case(ii) | $8.75-15.97$ | $84.02-91.25$ |
| Case(iii) | $3.38-10.51$ | $89.48-96.61$ |

## 6. ANALYSIS OF ARITHMETIC HUFFMAN COMPRESSION FOR OVERALL BWR\% AND BWS\%

This section compares the performance of Arithmetic and Huffman compression Techniques

### 6.1 For ( $\mathrm{x}, \mathrm{y}$ ) Coordinates of the encrypted data:

This section gives the overall percentage of bandwidth requirement and saved for above three cases by considering the both ( $\mathrm{x}, \mathrm{y}$ ) co-ordinates of the encrypted data

Table 25: Overall BWR \% and BWS\% for case(i)

| $\begin{aligned} & \hline \mathbf{S} \\ & \mathbf{l} . \end{aligned}$ | Input String | BWR\% |  | BWS\% |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Arith | Huff | Arith | Huff |
| 1 | ABCD | 25.78 | 26.5 | 74.21 | 73.4 |
| 2 | ABCDE | 26.25 | 27.5 | 73.75 | 72.5 |
| 3 | ABCDEF | 27.60 | 28.1 | 72.39 | 71.8 |
| 4 | ABCDEF | 26.78 | 28.5 | 73.21 | 71.4 |
| 5 | ABCDEF | 23.82 | 29.6 | 76.17 | 70.3 |
| 6 | ABCDEF | 21.18 | 30.5 | 78.81 | 69.4 |
| 7 | ABCDEF | 19.06 | 31.2 | 80.93 | 68.7 |
| 8 | ABCDEF | 17.61 | 31.8 | 82.38 | 68.1 |
| 9 | ABCDEF | 15.88 | 32.2 | 84.11 | 67.7 |
| 1 | ABCDEF | 14.90 | 32.6 | 85.09 | 67.3 |

Figure 16: Overall BWR \% \& BWS\%
From the above Table 25 and Figure 16, one can observe that, the overall percentage variation range in the bandwidth requirement and saving as follows:

| S.No. | Compression Type | BWR\% range | BWS\% range |
| :---: | :--- | :--- | :--- |
| 1 | Arithmetic | $14.92-27.6$ | $72.39-85.09$ |
| 2 | Huffman | $26.56-32.69$ | $67.32-73.43$ |

Table 26: Overall BWR\% and BWS\% for case (ii)

| Sl. <br> No. | Input String | OBWR\% |  | OBWS\% |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  |  | Arithmetic | Huffman | Arithmetic | Huffman |
| 1 | APPLE | 24.375 | 25 | 75.625 | 75 |

| 10 | ABCDEFGHIJKLM | 12.74038 | 13.94231 | 87.25962 | 86.05769 |

## Figure 19: Overall BWR\% and BWS\%

From the above Table 28 and Figure 19, one can observe that, the overall percentage variation range in the bandwidth requirement and saving as follows:

| S.No. | Compression Type | BWR\% range | BWS\% range |
| :---: | :---: | :---: | :---: |
| 1 | Arithmetic | $8.75-12.74$ | $87.25-91.25$ |
| 2 | Huffman | $9.375-13.94$ | $86.05-90.625$ |

Figure 20: Overall BWR\% and BWS\%
Table 29 Overall BWR\% and BWS\% for case(i)

| Sl. <br> No. | Input String | OBWR\% |  | OBWR\% |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Arithmetic | Huffman | Arithmetic | Huffman |
| 1 | APPLE | 8.75 | 8.75 | 91.25 | 91.25 |
| 2 | COMPUTER | 11.32813 | 11.32813 | 88.67188 | 88.67188 |
| 3 | DOCUMENT | 11.32813 | 11.32813 | 88.67188 | 88.67188 |
| 4 | ELEPHANT | 10.54688 | 10.54688 | 89.45313 | 89.45313 |
| 5 | GRAPHICS | 11.32813 | 11.32813 | 88.67188 | 88.67188 |
| 6 | HARDDISK | 10.54688 | 10.54688 | 89.45313 | 89.45313 |
| 7 | BEAUTIFUL | 11.11111 | 11.11111 | 88.88889 | 88.88889 |
| 8 | FLOWCHART | 11.45833 | 11.80556 | 88.54167 | 88.19444 |
| 9 | JNTUCEVZM | 11.45833 | 15.97222 | 88.54167 | 84.02778 |
| 10 | INFORMATION | 12.84722 | 10.7954 | 87.15278 | 89.2045 |

From the above Table 29 and Figure 20, one can observe that, the overall percentage variation range in the bandwidth requirement and saving as follows:

| S.No. | Compression Type | BWR\% range | BWS\% range |
| :--- | :--- | :--- | :--- |
| 1 | Arithmetic | $8.75-12.84$ | $87.15-91.25$ |
| 2 | Huffman | $8.75-15.97$ | $84.02-91.25$ |

Table 30 Overall BWR\% and BWS\% for case(iii):

| Sl. <br> No. | Input String | BWR\% |  | BWS\% |  |

| 9 | ABCDEFGHIJKL | 67.70833 | 87.23958 | 84.11458 | 88.02083 |
| 10 | ABCDEFGHIJKLM | 67.30769 | 86.05769 | 85.09615 | 87.25962 |

Figure 25: Strings Vs. BWS\% for (X,Y) \& X co-ordinates in Huffman compression And Arithmetic compression

From the above Table 34 and Figure 25 one can observe that, the overall percentage of bandwidth saving variation range for ( $\mathrm{x}, \mathrm{y}$ ) and x co-ordinates as follows.

| S.No. | Compression | BWS\% range |  |
| :--- | :--- | :--- | :--- |
|  |  | $(\mathrm{x} . \mathrm{v})$ | x |
| 1 | Arithmetic | $72.39-85.09$ | $87.25-91.25$ |
| 2 | Huffman | $67.3-73.43$ | $86.05-90.625$ |

Table 36: Overall BWS\% for (X,Y) Vs. X co-ordinates in Huffman compression And Arithmetic compression for Case (ii)

From the above Table 36 and Figure 26 one can observe that, the overall percentage of bandwidth saving variation range for $(\mathrm{x}, \mathrm{y})$ and x co-ordinates as follows.

| S.No. | Compression | BWS\% range |  |
| :--- | :--- | :--- | :--- |
|  |  | $(\mathrm{x}, \mathrm{y})$ | x |
| 1 | Arithmetic | $75.625-83.23$ | $87.15-91.25$ |
| 2 | Huffman | $68.75-75$ | $84.04-91.25$ |

Figure 26: Strings Vs. BWS\% for (X,Y) \& (X) co-ordinates in Huffman compression And Arithmetic compression

Figure 27: Strings Vs. BWS \% for (X,Y) Vs. (X) co-ordinates in Huffman compression And Arithmetic compression

From the above Table 36 and Figure 27 one can observe that, the overall percentage of bandwidth saving variation range for ( $\mathrm{x}, \mathrm{y}$ ) and x co-ordinates as follows.

| S.No. | Compression | BWS\% range |  |
| :--- | :--- | :--- | :--- |
|  |  | $(\mathrm{x}, \mathrm{y})$ | x |
| 1 | Arithmetic | $72.15-89.06$ | $89.48-96.61$ |
| 2 | Huffman | $82.67-91.625$ | $90.05-98.95$ |

## 9. CONCLUSION

We have conducted the experiments for the following cases, by considering only $x$ co-ordinate and both $(x, y)$ co-ordinates of the different encrypted text for transmission in Arithmetic as well as in Huffman for small text and as the Arithmetic compression is not suitable for large text, we consider only Huffman compression :

For small text, irrespective of the case, when we consider both $(x, y)$ coordinates for transmission, the overall Percentage of bandwidth requirement varies from $10.93 \%$ to $32.69 \%$ and the percentage of Bandwidth Saving (BWS) varies from $67.3 \%$ to $89.06 \%$ in Huffman whereas the overall percentage of bandwidth requirement varies from $9.375 \%$ to $27.6 \%$ and the percentage of Bandwidth Saving (BWS) varies from $72.39 \%$ to $90.625 \%$ in Arithmetic .

When we consider only $x$ co-ordinate for transmission, the overall percentage of bandwidth requirement varies from $3.38 \%$ to $15.97 \%$ and the percentage of Bandwidth Saving (BWS) varies from $84.02 \%$ to $96.61 \%$ in Huffman, whereas the overall percentage of bandwidth requirement varies from $1.04 \%$ to $12.84 \%$ and the percentage of Bandwidth Saving (BWS) varies from $87.15 \%$ to $98.95 \%$, in Arithmetic.

Hence, from the above experimental observations, we conclude that, irrespective of the data, Arithmetic Compression is more suitable for small text when compared with Huffman compression and for large text Huffman compression is suitable.
