# Strongly b*- Continuous Functions in Topological Spaces 

A.Poongothai and R.Parimelazhagan<br>Department of Science and Humanities, Karpagam College of Engineering, Coimbatore-32.Tamil Nadu, India

#### Abstract

In this paper, we present and study a new generation of strongly $\mathrm{b}^{*}$-continuous functions. Furthermore, we obtain basic properties and preservation theorems of strongly $b^{*-}$ continuous functions and relationships between them. Also we studied the strongly $b^{*}$ - open and closed maps.

## General Terms

2000 Mathematics Subject Classification: 54C05, 54C10.

## Keywords

strongly $b^{*}$ - continuous functions, strongly $b^{*}$-open maps and closed maps.

## 1. INTRODUCTION

Levine[11] introduced the concept of generalized closed sets in topological spaces and a class of topological spaces called $T_{1 / 2}$ - spaces. Dunham[7] and Dunham and Levine [8] further studied some properties of generalized closed sets and $T_{1 / 2}-$ spaces. Strong forms of continuous maps have been introduced and investigated by several mathematicians. strongly continuous maps, perfectly continuous maps, completely continuous maps, clopen continuous maps were introduced by Levine[13], Noiri[18], Munshi and Bassan[15] and Reilly and Vamanamurthy[20] respectively. Semi continuous functions have been studied by several authors. Dontchev[5], Ganster and Reilly[6] introduced contracontinuous functions and regular set - connected functions. Erdal Ekici [9] introduced and studied a new class of functions called almost contra-pre- continuous functions which generalize classes of regular set connected [6], contra- pre continuous [11], contra continuous [5], almost s - continuous [17] and perfectly continuous functions [18]. In this paper, we introduce and study the strongly $b^{*}$ - continuous functions in topological spaces. Also we studied the strongly $b^{*}$ - open and closed maps.

## 2. PRELIMINARIES

In this section, we begin by recalling some definitions
Definition 2.1[21]: A map f: $\mathrm{X} \rightarrow \mathrm{Y}$ fromatopological space X into a topological space Y is called semi- generalized continuous (sg-continuous) if $\mathrm{f}^{-1}(\mathrm{~V})$ is sg - closed in X for every closed set V of Y .

Definition 2.2[3]: A map f: $\mathrm{X} \rightarrow \mathrm{Y}$ is semi-continuous if and only if for every closed set B of $Y, f^{-1}(B)$ is semi-closed in X.

Definition 2.3[2]: A function f: $\mathrm{X} \rightarrow \mathrm{Y}$ is said to be generalized continuous (g-continuous) if $f^{-1}(V)$ is $g$-open in X for each open set V of Y .

Definition 2.4[10]: A function $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is said to be b-continuous if for each $x \in X$ and for each open set of $V$ of $Y$ containing $f(x)$, there exists $U \in b O(X, x)$ such that $\mathrm{f}(\mathrm{U}) \subseteq \mathrm{V}$.

Definition 2.5[22]:A function $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is said to be w-continuous if $f^{-1}(V)$ is $w-$ open in $X$ for each open set $V$ of Y.

Definition: 2.6 [14]: A function $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is said to be $\alpha$-continuous if $\mathrm{f}^{-1}(\mathrm{~V})$ is $\alpha$-open in X for each open set V of Y .
Definition: 2.7 [16]: Let $X$ and $Y$ be topological spaces. A map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is said to be weakly generalized continuous (wg-continuous) if the inverse image of every open set in Y is wg-open in X .

Definition 2.8:[4] A function $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is said to be $\alpha \mathrm{g}$ - continuous if $\mathrm{f}^{-1}(\mathrm{~V})$ is $\alpha \mathrm{g}$ - open in X for each open set V of Y .
Definition 2.9[1]: A map $\mathrm{f}: ~ \mathrm{X} \rightarrow \mathrm{Y}$ is semi precontinuous if and only if for every closed set B of Y, $\mathrm{f}^{-1}$ (B)is semi pre-closed in X .

Definition 2.10[19]: A subset $A$ of a topological space $(X, \tau)$ is called a strongly $b^{*}$ - closed set (briefly $s b^{*}$ - closed) if $d \operatorname{in}(A)) \subseteq U$ whenever $A \subseteq U$ and $U$ is $b$ open in X .

## 3. STRONGLY b* - CONTINUOUS FUNCTIONS

In this section, we introduce the new class of definition $\mathrm{sb}^{*}$-continuous function in topological space. Also we discuss some of its properties.
Definition 3.1: Let $X$ and $Y$ be topological spaces. A map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is called strongly $\mathrm{b}^{*}$ - continuous ( $\mathrm{sb}^{*}$ - continuous) if the inverse image of every open set in Y is $\mathrm{sb}^{*}$ - open in X.

Theorem 3.2: If a map $f: X \rightarrow Y$ is continuous then it is sb* - continuous but not conversely.
Proof: Let $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ be continuous. Let Fbe any open set in Y . The inverse image of $F$ is open in $X$. Since every open set is $\mathrm{sb}^{*}$-open set, inverse image of F is $\mathrm{sb}^{*}$ - open set in X . Therefore f is $\mathrm{sb}^{*}$ - continuous.

Remark 3.3: The converse of the above theorem need not be true as seen from the following example.

Example 3.4: Consider $\mathrm{X}=\{1,2,3\}$ with $\tau=\{X$, $\varphi,\{1,3\}\}, Y=\{a, b, c\}$ and $\sigma=\{Y, \varphi,\{b\},\{a, c\}\}$. Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma) \mathrm{be}$ defined by $\mathrm{f}(1)=\mathrm{a}, \mathrm{f}(3)=\mathrm{b}, \mathrm{f}(2)=\mathrm{c}$. Then f is $\mathrm{sb}^{*}$-continuous. But f is not continuous since for the open set $U=\{\mathrm{a}, \mathrm{c}\}$ in $\mathrm{Y}, \mathrm{f}^{-1}(\mathrm{U})=\{1,2\}$ is not open in X .

Theorem 3.5: Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a map from a topological space ( $\mathrm{X}, \tau$ ) in to a topological space ( $\mathrm{Y}, \sigma$ ). The statement (a) f is sb* - continuous is equivalent to the statement (b) the inverse image of each open set in Y is $\mathrm{sb}^{*}$-open in X.

Proof: Assume that $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is sb*-continuous. Let G be open in Y. Then $G^{c}$ is closed in Y. Since $f$ is sb*-continuous, $\mathrm{f}^{-1}\left(\mathrm{G}^{9}\right)$ is sb* -closed in X . But $\mathrm{f}^{-1}\left(\mathrm{G}^{9}\right)=\mathrm{X}$ -$f^{-1}(\mathrm{G})$. Thus $X-\mathrm{f}^{-1}(\mathrm{G})$ is sb*-closed in $X$ and so $\mathrm{f}^{-1}(\mathrm{G})$ is sb*-open in $X$. Therefore $(\mathrm{a}) \Rightarrow(\mathrm{b})$.

Conversely, assume that the inverse image of each open set in Y is sb*- open in X. Let F be any closed set in Y. Then $\mathrm{f}^{-1}\left(\mathrm{~F}^{\mathrm{c}}\right)$ is $\mathrm{sb}^{*}$ - open in X . But $\mathrm{f}^{-1}(\mathrm{~F})=\mathrm{X}-\mathrm{f}^{-1}(\mathrm{~F})$. Thus X -$\mathrm{f}^{-1}(\mathrm{~F})$ is $s b^{*}$ - open in X and so $\mathrm{f}^{-1}(\mathrm{~F})$ is $\mathrm{sb}^{*}$-closed in X . Therefore f is $\mathrm{sb}^{*}$-continuous. Hence (b) $\Rightarrow$ (a). Thus (a) and (b) are equivalent.

Theorem 3.6: Let $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ beasb*- continuous map from a topological space X in to a topological space Y and let H be a closed subset of $X$. Then the restriction $\mathrm{f} / \mathrm{H}: \mathrm{H} \rightarrow$ Y is $\mathrm{sb}^{*}$ - continuous where H is endowed with the relative topology.
Proof: Let F be any closed subset in Y. Since $f$ is $\mathrm{sb}^{*}$ - continuous, $\mathrm{f}^{-1}(\mathrm{~F})$ is $\mathrm{sb}^{*}$ - closed in X . Intersection of sb $^{*}$-closed sets is sb* - closed set. Thus if $\mathrm{f}^{-1}(\mathrm{~F}) \cap \mathrm{H}=\mathrm{H}_{1}$ then $H_{1}$ is sb* - closed set in X. Since $(f / H)^{-1}(\mathrm{~F})=H_{1}$, it is sufficient to show that $\mathrm{H}_{1}$ is $\mathrm{sb}^{*}$ - closed set in H . Let $\mathrm{G}_{1}$ be any open set of $H$ such that $H_{1} \subset G_{1}$. Let $G_{1}=G \cap H$ where $G$ is open in $X$. Now $H_{1} \subset G \cap H \cap G$. Since $H_{1}$ is sb* - closed in $\mathrm{X}, \overline{H_{1}} \subset G$. Now $l_{H}\left(H_{1}\right)=\overline{\mathrm{H}_{1}} \cap H \subset G \cap H=G_{1}$, where $\mathrm{cl}_{H}(\mathrm{~A})$ is the closure of a subset $\mathrm{A} \subset \mathrm{H}$ in a subspace H of X . Therefore $\mathrm{f} / \mathrm{H}$ is $\mathrm{sb}^{*}$ - continuous.
Remark 3.7: In the above theorem, the assumption of closedness of H cannot be removed as seen from the following example.

Example 3.8: Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{X, \varphi,\{b\}\}, \mathrm{Y}$ $=\{\mathrm{p}, \mathrm{q}\}$ and $\sigma=\{Y, \boldsymbol{\varphi},\{p\}\}$. Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be defined by $f(a)=f(c)=q, f(b)=p$. Now $H=\{a, b\}$ is not closed in $X$. Then f is $\mathrm{sb}^{*}$ - continuous but the restriction $\mathrm{f} / \mathrm{H}$ is not $\mathrm{sb}^{*}$-continuous. Since for the closed set $\mathrm{F}=\{\mathrm{q}\}$ in Y , $\mathrm{f}^{-1}(\mathrm{~F})=\{\mathrm{a}, \mathrm{c}\}$ and $\mathrm{f}^{-1}(\mathrm{~F}) \cap \mathrm{H}=\{\mathrm{a}\}$ is not $\mathrm{sb}^{*}$-closed in H .
Theorem 3.9: A map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is sb* - continuous if and only if the inverse image of every closed set in Y is $\mathrm{sb}^{*}$ closed in X .
Proof: Let F be a closed set in Y. Then $\mathrm{F}^{c}$ is open in Y. Since $f$ is $\mathrm{sb}^{*}$-continuous, $\mathrm{f}^{-1}(\mathrm{~F})$ is $\mathrm{sb}^{*}$ - open in X . But $\mathrm{f}^{-1}(\mathrm{Fv})=\mathrm{X}-\mathrm{f}^{-1}(\mathrm{~F})$ and so $\mathrm{f}^{-1}(\mathrm{~F})$ is sb* - closed in X .

Conversely, let the inverse image of every closed set in Y is sb* - closed set in X . Let V be an open set in Y and $V^{c}$ is closed in $Y$. Now by the assumption $f^{-1}(V)=X-$
$\mathrm{f}^{-1}(\mathrm{~V})$ is $s b^{*}$ - closed set in Y . Therefore $\mathrm{f}^{-1}(\mathrm{~V})$ is $s b^{*}$ - open in X . Then fis sb* - continuous.
Theorem 3.10: If a function $f: X \rightarrow Y$ is $s b^{*}$-continuous then it is b -continuous but not conversely.

Proof: Assume that a map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is sb* - continuous. let $V$ be an open set in $Y$. Since $f$ is $b^{*}$ - continuous $f^{-1}$ $(\mathrm{V})$ is $\mathrm{sb}^{*}$-open and hence b - open in X . Therefore f is b continuous
Remark 3.11: The converse of the above theorem need not be true as seen from the following example.

Example 3.12: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\boldsymbol{\varphi},\{a\},\{c\},\{a, c\}\} \quad, \quad \sigma=\{Y, \quad \varphi,\{b\},\{c\},\{b, c\}\}$ and $\mathrm{f}=\{(\mathrm{a}, \mathrm{b}),(\mathrm{b}, \mathrm{b}),(\mathrm{c}, \mathrm{c})\}$. Then f is b -continuous but not $\mathrm{sb}^{*}$-continuous. Since the inverse image of the open set $\{\mathrm{b}\}$ in Y is $\{\mathrm{a}, \mathrm{b}\}$ in X is not sb* - open.

Theorem 3.13: If a map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is $\alpha$-continuous then it is sb*-continuous but not conversely.
Proof: Assume that f is $\alpha$-continuous. Let V be an open set in Y . Since f is $\alpha$-continuous, $\mathrm{f}^{-1}(\mathrm{~V})$ is $\alpha$-open and hence it is sb $^{*}$-open in X . Thenf is $\mathrm{sb}^{*}$-continuous.
Remark 3.14: The converse of the above theorem be true as seen from the following example.
Example 3.15: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\boldsymbol{\varphi},\{b\},\{a, c\}\}$ and $\sigma=\{Y, \varphi,\{a, c\}\}$. Consider $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ which is defined as $f(a)=f(b)=b, f(c)=c$. This function $f$ is $\mathrm{sb}^{*}$ - continuous but not $\alpha$-continuous, Since the pre image of the open set $\{\mathrm{a}, \mathrm{c}\}$ in Y is $\{\mathrm{c}\}$ in X is not $\alpha$-open.

Theorem 3.16: If a map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is $\mathrm{sb}{ }^{*}$ - continuous then it is wg-continuous but not conversely.

Proof: Assume that a map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is sb*- continuous. Let V be an open set in Y. Since f is $\mathrm{sb}^{*}$ - continuous, $\mathrm{f}^{-1}(\mathrm{~V})$ is sb*-open and hence it is wg-open in $X$. Then f is wg continuous.

Remark 3.17: The converse of the above theorem need not be true as seen from the following exampl

Example 3.18: Let $\mathrm{X}=\mathrm{Y}=\square\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\square\{\mathrm{X}$, $\varphi, \square\{\mathrm{b}\}\}$ and $\sigma=\square\{\mathrm{Y}, \varphi, \square\{\mathrm{a}\}, \square\{\mathrm{a}, \mathrm{b}\}\}$ and f be the identity map. Then f is wg -continuous but not $\mathrm{sb}^{*}$ continuous, as the inverse image of the open set $\square\{\mathrm{a}\} \square$ in Y is $\square\{\mathrm{a}\}$ in X is not $\mathrm{sb}^{*}$ - open.

Theorem 3.19: If a map $f: X \rightarrow Y$ is w-continuous then it is sb*- continuous but not conversely.
Proof: Let $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is w -continuous and V be an open set in $Y$ then $f^{-1}(V)$ is $w$ - open and hence sb* - open in $X$. Then $f$ is $\mathrm{sb}^{*}$ - continuous. The converse of the above theorem need not be true as seen from the following example.

Exmple 3.20: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X, \varphi,\{b\}\}$ and $\sigma=\{Y, \varphi,\{b, c\}\}$ and f be the identity map. Then f is $\mathrm{sb}^{*}$ - continuous but not w -continuous, as the inverse image of the open set $\{b, c\}$ in Y is $\{\mathrm{b}, \mathrm{c}\}$ in X is not w- open.

Theorem 3.21: If a map $f: X \rightarrow Y$ is $\mathrm{sb}^{*}$-continuous then it is semi pre continuous but not conversely
Proof: Let $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is $\mathrm{sb}^{*}$-continuous and V be an open set in $Y$ then $f^{-1}(V)$ is $s b^{*}$-open set and hence semi pre open set in $X$. Then f is semi pre continuous.
Remark 3.22: The converse of the above theorem need not be true as seen from the following example.

Example 3.23: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\varphi,\{a\},\{c\},\{a, c\}\}$ and $\sigma=\{Y, \varphi,\{b, c\}\}$ and f be the identity map. Then $f$ is semi pre continuous but not sb* - continuous, since the inverse image of the open set $\{b, c\}$ in $Y$ is $\{b, c\}$ in $X$ is not $s^{*}$ - open.

Remark 3.24: From the above results the diagram follows:

Remark 3.25: The following example shows that the gcontinuous function and $\mathrm{sb}^{*}$ - continuous function are independent.

Example 3.26: Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\varphi,\{b\}\}$ and $\sigma=\{Y, \varphi,\{a\},\{b, c\}\}$. Let the function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}$, $\sigma$ ) be defined by $\mathrm{f}(\mathrm{a})=\mathrm{b}, \mathrm{f}(\mathrm{b})=\mathrm{c}, \mathrm{f}(\mathrm{c})=\mathrm{a}$. This function f is g - continuous but not $\mathrm{sb}^{*}$ - continuous since the inverse image of the open set $\{a\}$ in $Y$ is $\{c\}$ in $X$ is not $\mathrm{sb}^{*}$ open.

Example 3.27: Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\boldsymbol{\varphi},\{a\},\{a, b\}\}$ and $\sigma=\{Y, \varphi,\{a, b\}\}$. Let the function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow$
$(\mathrm{Y}, \sigma)$ be defined by $\mathrm{f}(\mathrm{a})=\mathrm{f}(\mathrm{c})=\mathrm{b}$ and $\mathrm{f}(\mathrm{b})=\mathrm{c}$. Here the inverse image of the open set $\{a, b\}$ in $Y$ is $\{a, c\}$ in $X$ which is $\mathrm{sb}^{*}$ - open but not g - open. Therefore this function is $\mathrm{sb}^{*}$ - continuous but not g-continuous
Remark 3.28: The following example shows that the $\alpha \mathrm{g}$ - continuous function and $\mathrm{sb}^{*}$ - continuous function are independent.
Example 3.29: Consider $X=Y=\{a, b, c\}$ with $\tau=\{X, \boldsymbol{\varphi},\{b\}\}$ and $\sigma=\{Y, \boldsymbol{\varphi},\{c\}\}$. Let the function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}$, $\sigma$ ) be defined by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{c}$. Here the inverse image of the open set $\{\mathrm{c}\}$ in Y is $\{\mathrm{c}\}$ in X which is $\alpha \mathrm{g}$ open set but not $\mathrm{sb}^{*}$ - open. Therefore the defined function is $\alpha \mathrm{g}$-continuous but not $\mathrm{sb}^{*}$-continuous.

Example 3.30: Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\square\{$ $X, \varphi, \square\{a\},\{a, b\}\}$ and $\sigma=\square\{Y, \varphi, \square\{a, c\}\}$. Let the function $\quad \mathrm{f}:(\mathrm{X}, \tau) \square \rightarrow(\mathrm{Y}, \sigma)$ be defined by $\mathrm{f}(\mathrm{a})$ $=c, f(b)=b$ and $f(c)=a$. Here the inverse image of the open set $\{a, c\}$ in $Y$ is $\square\{a, c\}$ in $X$ is $s b^{*}$ - open but not $\alpha \mathrm{g}$ - open. Therefore the defined function is $\mathrm{sb}^{*}$ continuous but not $\alpha$ g-continuous.

Remark 3.31: The following example shows that the $\mathrm{sb}^{*}$ - continuous function and sg - continuous function are independent

Example 3.32: Consider $\mathrm{X}=\mathrm{Y}=\square\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\varphi, \square\{a\},\{c\},\{a, c\}\}$ and $\sigma=\square\{Y, \varphi, \square\{a, c\}\}$. Let the function $\mathrm{f}:(\mathrm{X}, \tau) \square \rightarrow(\mathrm{Y}, \sigma)$ be defined by $\mathrm{f}(\mathrm{a})=\mathrm{b}$, $f(b)=a, f(c)=c$. Here the inverse image of the open set $\square\{a, c\}$ in $Y$ is $\square\{b, c\}$ in $X$ is sg-open set but not $\mathrm{sb}^{*}$ - open. Therefore the defined function is sg continuous but not $\mathrm{sb}^{*}$-continuous.

Example 3.33: Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\varphi,\{a, c\}\}$ and $\sigma=\{Y, \varphi,\{a\},\{a, b\}\}$. Let the function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow$ $(\mathrm{Y}, \sigma)$ be defined by $\mathrm{f}(\mathrm{a})=\mathrm{c}, \mathrm{f}(\mathrm{b})=\mathrm{b}$ and $\mathrm{f}(\mathrm{c})=\mathrm{a}$. Here the inverse image of the open set $\{a, b\}$ in $Y$ is $\{b, c\}$ in $X$ is $\mathrm{sb}^{*}$ - open but not sg-open. Therefore the defined function is sg - continuous but not $\mathrm{sb}^{*}$-continuous.
Remark 3.34: The following example shows that the $\mathrm{sb}^{*}$ - continuous function and semi - continuous function are independent.

Example 3.35: Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\varphi,\{a, c\}\}$ and $\sigma=\{Y, \varphi,\{a\},\{b\},\{a, b\}\}$. Let the function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be defined by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{c}, \mathrm{f}(\mathrm{c})=\mathrm{b}$. Here the inverse image of the open set $\{a\}$ in $Y$ is $\{a\}$ in $X$ which is not semi open but it is $\mathrm{sb}^{*}$ - open. Therefore the defined function is $\mathrm{sb}^{*}$ - continuous but not semicontinuous.

Example 3.36: Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}$ with $\tau=\{X$, $\varphi,\{a\},\{c\},\{a, c\}\}$ and $\sigma=\{Y, \varphi,\{b, c\}\}$. Let the function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be defined by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{c}$ and $\mathrm{f}(\mathrm{c})=\mathrm{b}$. Here the inverse image of the open set $\{b, c\}$ in $Y$ is $\{b, c\}$ in $X$ which is semi- open but not $\mathrm{sb}^{*}$ - open. Therefore the defined function is semi - continuous but not $\mathrm{sb}^{*}$-continuous.

Remark 3.37: From the above results the diagram follows:

## 4. STRONGLY b*- OPEN AND CLOSED MAPS

In this section we introduce the new concept of sb* closed maps and studied some of their properties
Definition 4.1: Let $X$ and $Y$ be a topological spaces. A map $f: X \rightarrow Y$ is called strongly $b^{*}$-closed (sb* - closed) map if the image of every closed set in X is $\mathrm{sb}^{*}$ - closed set in Y .

Theorem 4.2: Every closed map is sb*-closed but not conversely.

Proof: Let $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ be closed map and V be a closed set in X . Then $\mathrm{f}(\mathrm{V})$ is closed and hence $\mathrm{sb}^{*}$-closed in Y . Thus f is $\mathrm{sb}^{*}$ - closed. The converse of the above theorem need not be true as seen from the following example.

Example 4.3: Consider $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \quad \tau=\{X$, $\varphi,\{a\}\}$ and $\sigma=\{Y, \varphi,\{a\},\{a, b\}\}$ and a map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ be defined by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{f}(\mathrm{c})=\mathrm{b}$. This function f is $\mathrm{sb}^{*}$-closed but not closed as $f(\{b, c\})=\{b\}$ is not closed in $Y$.

Theorem 4.4: If a map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is continuous and $\mathrm{sb}^{*}$-closed, A is $\mathrm{sb}^{*}$ - closed set of X then $\mathrm{f}(\mathrm{A})$ is sb*-closed in Y.

Proof: Let $f(A) \subseteq O$, where $O$ is b-open set of Y. Since $f$ is continuous $\mathrm{f}^{-1}(\mathrm{O})$ is $b$-open set containing A . Hence $\operatorname{cl}(\operatorname{int}(\mathrm{A})) \subseteq \mathrm{f}^{-1}(\mathrm{O})$, as A is $\mathrm{sb}^{*}$-closed. Since f is $\mathrm{sb}^{*}$-closed $\mathrm{f}(\mathrm{cl}(\operatorname{int}(\mathrm{A})))$ is a $\mathrm{sb}^{*}$-closed set contained in the b-open set O , which implies $\mathrm{cl}(\mathrm{int} \mathrm{f}(\mathrm{A})) \subseteq \mathrm{O}$. So, $\mathrm{f}(\mathrm{A})$ is sb*${ }^{*}$-open in Y .
Theorem 4.5: A map $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ is sb*-closed if and only if for each subset $S$ of $Y$ and for each open set $U$ containing $\mathrm{f}^{-1}(\mathrm{~S})$ there is a sb*-open set V of Y such that $\mathrm{S} \subseteq \mathrm{V}^{*}$ and $\mathrm{f}^{-1}(V) \subseteq \mathrm{U}$.

Proof: Suppose f is $\mathrm{sb}^{*}$-closed. Let S be a subset of Y and $U$ be a open set of $X$ such that $f^{-1}(S) \subseteq U . V=Y-f(X-U)$ is a sb* - open set containing $S$ such that $\mathrm{f}^{-1}(V) \subseteq \mathrm{U}$.
For the converse, suppose that F is a closed set of X . Then $\mathrm{f}^{-1}(\mathrm{Y}-\mathrm{f}(\mathrm{F})) \subseteq \mathrm{X}-\mathrm{F}$ and $\mathrm{X}-\mathrm{F}$ is open. By hypothesis, there is a sb*-open set $V$ of $Y$ such that $Y-f(F) \subseteq V$ and $f^{-1}(V) \subseteq X-F$. Therefore $F \subseteq X-f^{1}(V)$. Hence $Y-V \subseteq f(F) \subseteq f\left(X-f^{1}(V) \subseteq Y-V\right.$. Which implies $f(F)=Y-V$. Since $Y-V$ is $s^{*}$-closed, $f(F)$ is $\mathrm{sb}^{*}$-closed and thus f is $\mathrm{sb}^{*}$-closed map.

Theorem 4.7: If a map $f: X \rightarrow Y$ is closed and a map $g$ : $\mathrm{Y} \rightarrow \mathrm{Z}$ is sb*-closed then gof: $\mathrm{X} \rightarrow \mathrm{Z}$ is sb* -closed.

Proof: Let $V$ be a closed set in $X$. Since $f: X \rightarrow Y$ is closed, $\mathrm{f}(\mathrm{V})$ is closed set in Y . Since $\mathrm{g}: \mathrm{Y} \rightarrow \mathrm{Z}$ is $\mathrm{sb}^{*}$ - closed, $\mathrm{h}\left(\mathrm{f}(\mathrm{V})\right.$ ) is $\mathrm{sb}^{*}$ - closed set in Z . Therefore (g f ): $\mathrm{X} \rightarrow \mathrm{Z}$ is sb ${ }^{*}$ - closed map.
