## ABSTRACT

A strong form of  $\Lambda_a$ -irresolute function called completely  $\Lambda_a$ -irresolute function is introduced and several characterizations of such functions are investigated. The relationships among completely  $\Lambda_a$ -irresolute functions, separation axioms and covering properties are also investigated.

## Keywords

$\Lambda_a$ -closed sets,  $\Lambda_a$ -open sets, completely  $\Lambda_a$ -irresolute functions,  $\Lambda_a$ -compact spaces,  $\Lambda_a$ -connected spaces and  $\Lambda_a$ -normal spaces.

## 1. INTRODUCTION

In 1972, Crossley and Hildebrand [2] introduced the notion of irresoluteness. Various types of irresolute functions have been introduced over the course of years. Recently Thivagar et al.[5],introduced a new class of sets called  $\Lambda_a$ -sets via a-closed sets and investigated several properties of such sets. The purpose of this paper is to introduce a new form of irresolute function called completely  $\Lambda_a$ -irresolute function which is stronger than  $\Lambda_a$ -irresolute functions. We also investigate the relationships among completely  $\Lambda_a$ -irresolute functions, separation axioms and covering properties.

## 2. PRELIMINARIES

Throughout the paper  $(X, \tau)$  and  $(Y, \sigma)$  and  $(Z, \eta)$  (or simply  $X, Y$  and  $Z$ ) represent topological spaces on which no separation axioms are assumed. For a subset  $A$  of  $X$ ,  $\text{cl}(A)$ ,  $\text{int}(A)$  and  $A^c$  denote the closure of  $A$ , interior of  $A$  and the complement of  $A$  respectively. A subset  $A$  of a topological space  $X$  is called  $\delta$ -closed if  $A = \text{cl}_\delta(A)$  where  $\text{cl}_\delta(A) = \{x \in X : \text{int}(\text{cl}(U)) \cap A \neq \emptyset, U \in \tau \text{ and } x \in U\}$ . The complement of  $\delta$ -closed set is called  $\delta$ -open set. A subset  $A$  of a topological space  $X$  is called regular open if  $A = \text{int}(\text{cl}(A))$ . The complement of regular open set is called regular closed set. A subset  $A$  of a topological space  $X$  is called an a-open set [3] if  $A \subset \text{int}(\text{cl}(\text{int}_\delta(A)))$ . The complement of an a-open set is called an a-closed set. A

subset  $A$  of a topological space  $X$  is called a  $\delta$ -semiopen [7] if  $A \subset \text{cl}(\text{int}_\delta(A))$ . The complement of a  $\delta$ -semiopen set is called a  $\delta$ -semiclosed set.

**Definition 2.1.** A subset  $A$  of a topological space  $(X, \tau)$  is said to be a  $\Lambda_a$ -set [5] if  $\Lambda_a(A) = A$  where  $\Lambda_a(A) = \bigcap \{O \in \text{aO}(X, \tau) : A \subset O\}$ .

**Definition 2.2.** A subset  $A$  of a topological space  $(X, \tau)$  is said to be  $\Lambda_a$ -closed [5] if  $A = T \cap C$  where  $T$  is a  $\Lambda_a$ -set and  $C$  is an a-closed set.  $A$  is said to be  $\Lambda_a$ -open if  $X - A$  is  $\Lambda_a$ -closed.

**Definition 2.3.** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called

- (i) strongly continuous [4] if  $f^{-1}(V)$  is clopen in  $X$  for every subset  $V$  in  $Y$ .
- (ii) completely continuous [8] if  $f^{-1}(V)$  is regular open in  $X$  for every open set  $V$  in  $Y$ .
- (iii) almost a-continuous [3] if  $f^{-1}(V)$  is a-open in  $X$  for every regular open set  $V$  in  $Y$ .
- (iv)  $\Lambda_a$ -continuous [5] if  $f^{-1}(V)$  is  $\Lambda_a$ -open in  $X$  for every open set  $V$  in  $Y$ .
- (v)  $\Lambda_a$ -irresolute [5] if  $f^{-1}(V)$  is  $\Lambda_a$ -open in  $X$  for every  $\Lambda_a$ -open set  $V$  in  $Y$ .
- (vi) quasi  $\Lambda_a$ -irresolute [5] if  $f^{-1}(V)$  is  $\Lambda_a$ -open in  $X$  for every a-open set  $V$  in  $Y$ .
- (vii) completely  $\alpha$ -irresolute [10] if  $f^{-1}(V)$  is regular open in  $X$  for every  $\alpha$ -open set  $V$  in  $Y$ .
- (viii) completely  $\delta$ -semi-irresolute [8] if  $f^{-1}(V)$  is regular open in  $X$  for every  $\delta$ -semiopen set  $V$  in  $Y$ .
- (ix) R-map [8] if  $f^{-1}(V)$  is regular open in  $X$  for every regular open set  $V$  in  $Y$ .
- (x) a-irresolute [3] if  $f^{-1}(V)$  is a-open in  $X$  for every a-open set  $V$  in  $Y$ .
- (xii) a\*-closed [3] if  $f(V)$  is a-closed in  $X$  for every a-closed set  $V$  in  $Y$ .

### 3. COMPLETELY $\Lambda_a$ -IRRESOLUTE FUNCTIONS

In this section we introduce completely  $\Lambda_a$ -irresolute functions and obtain several properties concerning such functions.

**Definition 3.1.** A function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is said to be completely  $\Lambda_a$ -irresolute function if the inverse image of every  $\Lambda_a$ -open subset of  $Y$  is regular open in  $X$ .

**Example 3.2.** Let  $X = \{a, b, c, d\} = Y$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{c, d\}, \{a, c, d\}, \{b, c, d\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{c\}, \{a, b\}, \{a, c\}, \{a, b, c\}, \{a, c, d\}, Y\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = d$ ,  $f(b) = c$ ,  $f(c) = a$  and  $f(d) = b$ . Then  $f$  is completely  $\Lambda_a$ -irresolute.

**Theorem 3.3** The following are equivalent for a function  $f : (X, \tau) \rightarrow (Y, \sigma)$

- (i)  $f$  is completely  $\Lambda_a$ -irresolute.
- (ii) the inverse image of every  $\Lambda_a$ -closed subset of  $Y$  is regular closed in  $X$ .

**Proof:** (i)  $\Rightarrow$  (ii) Suppose  $f$  is completely  $\Lambda_a$ -irresolute.

Let  $V$  be a  $\Lambda_a$ -closed subset of  $Y$ . Then  $Y - V$  is  $\Lambda_a$ -open in  $Y$ . By (i),  $f^{-1}(Y - V) = X - f^{-1}(V)$  is regular open in  $X$  which implies  $f^{-1}(V)$  is regular closed in  $X$ . Thus (ii) holds.

Similarly (ii)  $\Rightarrow$  (i) holds.

**Remark 3.4.** It is clear that every strongly continuous function is completely  $\Lambda_a$ -irresolute. However the converse is not true as shown by the following example.

**Example 3.5.** Let  $X$  and  $\tau$  be same as in example 3.2. Then  $f$  is completely  $\Lambda_a$ -irresolute but not strongly continuous since  $f^{-1}\{b\} = \{d\}$  is not clopen in  $X$ .

**Theorem 3.6.** Every completely  $\Lambda_a$ -irresolute function is

- (i)  $\Lambda_a$ -irresolute.
- (ii) a-irresolute.
- (iii) quasi- $\Lambda_a$ -irresolute.
- (iv) a R-map.
- (v) almost a-continuous.

**Proof :**

(i) Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a completely  $\Lambda_a$ -irresolute function and  $V$  be  $\Lambda_a$ -open in  $Y$ . Since  $f$  is completely  $\Lambda_a$ -

irresolute,  $f^{-1}(V)$  is regular open in  $X$ . Since every regular open set is a-open [7],  $f^{-1}(V)$  is a-open in  $X$ . By proposition 4.20[5],

$f^{-1}(V)$  is  $\Lambda_a$ -open in  $X$  which implies  $f$  is  $\Lambda_a$ -irresolute.

(ii) Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a completely  $\Lambda_a$ -irresolute function and  $V$  be an a-open in  $Y$ . By proposition 4.20[5],  $V$  is  $\Lambda_a$ -open in  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(V)$  is regular open in  $X$ . Since every regular open set is a-open [7],  $f^{-1}(V)$  is a-open in  $X$  which implies  $f$  is a-irresolute.

(iii) Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a completely  $\Lambda_a$ -irresolute function and  $V$  be an a-open in  $Y$ . By proposition 4.20[5],  $V$  is  $\Lambda_a$ -open in  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(V)$  is regular open in  $X$ . Since every regular open set is a-open [7],  $f^{-1}(V)$  is a-open in  $X$ . By proposition 4.20[5],  $f^{-1}(V)$  is  $\Lambda_a$ -open in  $X$  which implies  $f$  is quasi  $\Lambda_a$ -irresolute.

(iv) Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a completely  $\Lambda_a$ -irresolute function and  $V$  be a regular open set in  $Y$ . Since every regular open set is a-open [7],  $V$  is a-open in  $Y$ . By proposition 4.20[5],  $V$  is  $\Lambda_a$ -open in  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(V)$  is regular open in  $X$  which implies  $f$  is a R-map.

(v) Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a completely  $\Lambda_a$ -irresolute function and  $V$  be a regular open set in  $Y$ . Since every regular open set is a-open [7],  $V$  is a-open in  $Y$ . By proposition 4.20[5],  $V$  is  $\Lambda_a$ -open in  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(V)$  is regular open in  $X$  which implies  $f^{-1}(V)$  is a-open in  $X$  and hence  $f$  is almost a-continuous.

**Remark 3.7.** The converses of the above theorem are not true as shown by the following examples.

**Example 3.8.** Let  $X = \{a, b, c, d\} = Y$ ,  $\tau = \{\emptyset, \{a\}, \{c\}, \{a, b\}, \{a, c\}, \{a, b, c\}, \{a, b, d\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{b, c\}, \{a, b, c\}, Y\}$ .

Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b$ ,  $f(b) = c$ ,  $f(c) = a$  and  $f(d) = d$ . Then  $f$  is a-irresolute and R-map but not completely  $\Lambda_a$ -irresolute since  $f^{-1}(\{a, d\}) = \{c, d\}$  is not regular open in  $X$  where  $\{a, d\}$  is  $\Lambda_a$ -open in  $Y$ .

**Example 3.9.** Let  $X = \{a, b, c, d\} = Y$ ,  $\tau = \{\emptyset, \{a\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{c, d\}, \{a, c, d\}, X\}$  and  $\sigma = \{\emptyset, \{c\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}, Y\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = c$ ,  $f(b) = d$ ,  $f(c) = b$  and  $f(d) = a$ . Then  $f$  is  $\Lambda_a$ -irresolute and almost a-continuous but not completely  $\Lambda_a$ -irresolute since  $f^{-1}(\{a, b, d\}) = \{b, c, d\}$  is not regular open in  $X$  where  $\{a, b, d\}$  is  $\Lambda_a$ -open in  $Y$ .

**Example 3.10** Let  $X = \{a, b, c, d\} = Y$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{b, c\}, \{a, b, c\}, Y\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = c$ ,  $f(b) = d$ ,  $f(c) = a$  and  $f(d) = b$ . Then  $f$  is quasi- $\Lambda_a$ -irresolute but not completely  $\Lambda_a$ -irresolute since  $f^{-1}(\{a, d\}) = \{b, c\}$  is not regular open in  $X$  where  $\{a, d\}$  is  $\Lambda_a$ -open in  $Y$ .

**Definition 3.11** A space  $(X, \tau)$  is said to be  $\Lambda_a$ -space [5] if every  $\Lambda_a$ -closed subset of  $X$  is  $a$ -closed in  $X$ .

**Theorem 3.12** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a completely  $\delta$ -semi-irresolute function where  $Y$  is a  $\Lambda_a$ -space, then  $f$  is completely  $\Lambda_a$ -irresolute.

**Proof :** Let  $V$  be a  $\Lambda_a$ -closed subset of  $Y$ . Since  $Y$  is a  $\Lambda_a$ -space,  $V$  is  $a$ -closed in  $Y$ . Since every  $a$ -closed set is  $\delta$ -semiclosed [7],  $V$  is  $\delta$ -semiclosed in  $Y$ . Now  $f$  is completely  $\delta$ -semi-irresolute implies  $f^{-1}(V)$  is regular closed in  $X$  and so  $f$  is completely  $\Lambda_a$ -irresolute.

**Theorem 3.13** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a completely  $\alpha$ -irresolute function where  $Y$  is a  $\Lambda_a$ -space, then  $f$  is completely  $\Lambda_a$ -irresolute.

**Proof :** Let  $V$  be a  $\Lambda_a$ -closed subset of  $Y$ . Since  $Y$  is a  $\Lambda_a$ -space,  $V$  is  $a$ -closed in  $Y$ . Since every  $a$ -closed set is  $\alpha$ -closed [7],  $V$  is  $\alpha$ -closed in  $Y$ . Now  $f$  is completely  $\alpha$ -irresolute implies  $f^{-1}(V)$  is regular closed in  $X$  and so  $f$  is completely  $\Lambda_a$ -irresolute.

**Theorem 3.14** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  be functions. Then the following properties hold:

(i) If  $f$  is completely  $\Lambda_a$ -irresolute and  $g$  is  $\Lambda_a$ -continuous, then  $g \circ f$  is completely continuous.

(ii) If  $f$  is completely  $\Lambda_a$ -irresolute and  $g$  is  $\Lambda_a$ -irresolute, then  $g \circ f$  is completely  $\Lambda_a$ -irresolute.

(iii) If  $f$  is almost  $a$ -continuous and  $g$  is completely  $\Lambda_a$ -irresolute, then  $g \circ f$  is  $\Lambda_a$ -irresolute.

(iv) If  $f$  is completely continuous and  $g$  is completely  $\Lambda_a$ -irresolute, then  $g \circ f$  is completely  $\Lambda_a$ -irresolute.

(v) If  $f$  is a  $R$ -map and  $g$  is completely  $\Lambda_a$ -irresolute, then  $g \circ f$  is completely  $\Lambda_a$ -irresolute.

(vi) If  $f$  is completely  $\Lambda_a$ -irresolute and  $g$  is a  $R$ -map, then  $g \circ f$  is almost  $a$ -continuous.

(vii) If  $f$  is almost  $a$ -continuous and  $g$  is completely  $\Lambda_a$ -irresolute, then  $g \circ f$  is  $a$ -irresolute.

**Proof.** (i) Let  $V$  be an open set in  $Z$ . Since  $g$  is  $\Lambda_a$ -continuous,  $g^{-1}(V)$  is  $\Lambda_a$ -open in  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is regular open in  $X$  and hence  $g \circ f$  is completely continuous.

Proofs of (ii) – (vii) can be obtained similarly.

**Theorem 3.15** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is a surjective,  $a^*$ -closed function and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  is a function such that  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is completely  $\Lambda_a$ -irresolute, then  $g$  is  $\Lambda_a$ -irresolute.

**Proof.** Let  $V$  be a  $\Lambda_a$ -closed set in  $Z$ . Since  $g \circ f$  is completely  $\Lambda_a$ -irresolute,  $(g \circ f)^{-1}(V) = f^{-1}(g^{-1}(V))$  is regular closed in  $X$ . Since every regular closed set is  $a$ -closed [7],  $f^{-1}(g^{-1}(V))$  is  $a$ -closed in  $X$ . Now  $f$  is  $a^*$ -closed and surjective implies  $f(f^{-1}(g^{-1}(V))) = g^{-1}(V)$  is  $\Lambda_a$ -closed in  $Y$ . Thus  $g$  is  $\Lambda_a$ -irresolute.

**Remark 3.16** From the above results we have the following diagram where  $A \rightarrow B$  represents  $A$  implies  $B$  but not conversely.

1. completely  $\Lambda_a$ -irresolute
2. almost  $a$ -continuous
3.  $a$ -irresolute
4. quasi  $\Lambda_a$ -irresolute
5.  $\Lambda_a$ -irresolute
6. strongly continuous

#### 4. CHARACTERIZATIONS

**Lemma 4.1.[9]** Let  $S$  be an open subset of a topological space  $(X, \tau)$ . Then the following hold:

(i) If  $U$  is regular open in  $X$ , then so is  $U \cap S$  in the subspace  $(S, \tau_S)$ .

(ii) If  $B \subset S$  is regular open in  $(S, \tau_S)$  there exists a regular open set  $U$  in  $(X, \tau)$  such that  $B = U \cap S$ .

**Theorem 4.2.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is completely  $\Lambda_a$ -irresolute and  $A$  is any open subset in  $X$ , then the restriction  $f|_A : A \rightarrow Y$  is completely  $\Lambda_a$ -irresolute.

**Proof.** Let  $V$  be any  $\Lambda_a$ -open subset of  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(V)$  is regular open in  $X$ . Since  $A$  is open in  $X$ , by lemma 4.1,  $(f|_A)^{-1}(V) = A \cap f^{-1}(V)$  is regular open in  $A$  and so  $f|_A$  is completely  $\Lambda_a$ -irresolute.

**Lemma 4.3.[1]** Let  $Y$  be a preopen subset of a topological space  $(X, \tau)$ . Then  $Y \cap U$  is regular open in  $Y$  for every regular open subset  $U$  of  $X$ .

**Theorem 4.4.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is completely  $\Lambda_a$ -irresolute and  $A$  is any preopen subset of  $X$ , then the restriction  $f|_A : A \rightarrow Y$  is completely  $\Lambda_a$ -irresolute.

**Proof.** Let  $V$  be any  $\Lambda_a$ -open subset of  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(V)$  is regular open in  $X$ . Since  $A$  is preopen in  $X$ , by lemma 4.3,  $(f|_A)^{-1}(V) = A \cap f^{-1}(V)$  is regular open in  $A$  and so  $f|_A$  is completely  $\Lambda_a$ -irresolute.

**Theorem 4.5.** A topological space  $(X, \tau)$  is connected if every completely  $\Lambda_a$ -irresolute function from a space  $X$  into any  $T_0$ -space  $Y$  is constant

**Proof.** Suppose  $X$  is not connected and every completely  $\Lambda_a$ -irresolute function from a space  $X$  into  $Y$  is constant. Since  $X$  is not connected, there exists a proper nonempty clopen subset  $A$  of  $X$ . Let  $Y = \{a, b\}$  and  $\tau = \{\emptyset, \{a\}, \{b\}, Y\}$  be a topology for  $Y$ . Let  $f : X \rightarrow Y$  be a function such that  $f(A) = \{a\}$  and  $f(X - A) = \{b\}$ . Then  $f$  is a non-constant completely  $\Lambda_a$ -irresolute function such that  $Y$  is  $T_0$ , a contradiction. Hence  $X$  must be connected.

**Definition 4.6.** A topological space  $(X, \tau)$  is said to be

- (i)  $\Lambda_a$ -connected [5] if  $X$  cannot be written as a disjoint union of two nonempty  $\Lambda_a$ -open subsets in  $X$ .
- (ii)  $r$ -connected [10] if  $X$  cannot be written as a disjoint union of two nonempty regular open subsets in  $X$ .
- (iii) hyperconnected [8] if every open subset of  $X$  is dense.

**Theorem 4.7.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is completely  $\Lambda_a$ -irresolute surjection and  $X$  is  $r$ -connected, then  $Y$  is  $\Lambda_a$ -connected.

**Proof.** Suppose  $Y$  is not  $\Lambda_a$ -connected. Then  $Y = A \cup B$  where  $A$  and  $B$  are disjoint nonempty  $\Lambda_a$ -open subsets in  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute surjection,  $f^{-1}(A)$  and  $f^{-1}(B)$  are regular open sets in  $X$  such that  $X = f^{-1}(A) \cup f^{-1}(B)$  and  $f^{-1}(A) \cap f^{-1}(B) = \emptyset$  which shows that  $X$  is not  $r$ -connected, a contradiction. Hence  $Y$  is  $\Lambda_a$ -connected.

**Theorem 4.8.** Completely  $\Lambda_a$ -connected images of hyperconnected spaces are  $\Lambda_a$ -connected.

**Proof.** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a completely  $\Lambda_a$ -irresolute function such that  $X$  is hyperconnected. Assume that  $B$  is a proper  $\Lambda_a$ -clopen subset of  $Y$ . Then  $A = f^{-1}(B)$  is both regular open and regular closed set in  $X$  as  $f$  is completely  $\Lambda_a$ -irresolute. This clearly contradicts the fact that  $X$  is hyperconnected. Thus  $Y$  is  $\Lambda_a$ -connected.

**Definition 4.9.** A topological space  $(X, \tau)$  is said to be

- (i)  $\Lambda_a$ - $T_1$  [6] if for every pair of distinct points  $x$  and  $y$ , there exist  $\Lambda_a$ -open sets  $G$  and  $H$  containing  $x$  and  $y$  respectively such that  $y \notin G$  and  $x \notin H$ .
- (ii)  $\Lambda_a$ - $T_2$  [6] if for every pair of distinct points  $x$  and  $y$ , there exist disjoint  $\Lambda_a$ -open sets  $G$  and  $H$  containing  $x$  and  $y$  respectively.
- (iii)  $r$ - $T_1$  [10] if for every pair of distinct points  $x$  and  $y$ , there exist  $r$ -open sets  $G$  and  $H$  containing  $x$  and  $y$  respectively such that  $x \notin H$  and  $y \notin G$ .

**Theorem 4.10.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is completely  $\Lambda_a$ -irresolute injective function and  $Y$  is  $\Lambda_a$ - $T_1$ , then  $X$  is  $r$ - $T_1$ .

**Proof.** Since  $Y$  is  $\Lambda_a$ - $T_1$ , for  $x \neq y$  in  $X$ , there exist  $\Lambda_a$ -open sets  $V$  and  $W$  such that  $f(x) \in V$ ,  $f(y) \notin V$ ,  $f(x) \notin W$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(V)$  and  $f^{-1}(W)$  are regular open sets in  $X$  such that  $x \in f^{-1}(V)$ ,  $y \in f^{-1}(W)$ ,  $x \notin f^{-1}(W)$ ,  $y \notin f^{-1}(V)$ . This shows that  $X$  is  $r$ - $T_1$ .

**Theorem 4.11.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is completely  $\Lambda_a$ -irresolute injective function and  $Y$  is  $\Lambda_a$ - $T_2$ , then  $X$  is  $T_2$ .

**Proof.** Similar to the proof of theorem 4.10

**Definition 4.12.** A topological space  $(X, \tau)$  is said to be

- (i)  $\Lambda_a$ -compact [5], if every  $\Lambda_a$ -open cover of  $X$  has a finite subcover.
- (ii) nearly compact [11], if every regular open cover of  $X$  has a finite subcover.

**Theorem 4.13.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is completely  $\Lambda_a$ -irresolute surjective function and  $X$  is nearly compact, then  $Y$  is  $\Lambda_a$ -compact.

**Proof.** Let  $\{V_\alpha : \alpha \in I\}$  be a cover of  $Y$  by  $\Lambda_a$ -open subsets of  $Y$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,

$\{f^{-1}(V_\alpha) : \alpha \in I\}$  is a regular open cover of  $X$ . Since  $X$  is nearly compact, there exists a finite subset  $I_0$  of  $I$  such that  $X = \bigcup \{f^{-1}(V_\alpha) : \alpha \in I_0\}$ . Since  $f$  is surjective,  $Y = \bigcup \{V_\alpha : \alpha \in I_0\}$  and hence  $Y$  is  $\Lambda_a$ -compact.

**Definition 4.14.** A topological space  $(X, \tau)$  is said to be  $\Lambda_a$ -normal [5], if each pair of disjoint closed sets can be separated by disjoint  $\Lambda_a$ -open sets.

**Theorem 4.15.** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is completely  $\Lambda_a$ -irresolute, closed injection and  $Y$  is  $\Lambda_a$ -normal, then  $X$  is normal.

**Proof.** Let  $E$  and  $F$  be disjoint closed subsets of  $X$ . Since  $f$  is closed,  $f(E)$  and  $f(F)$  are disjoint closed subsets of  $Y$ . Since  $f$  is  $\Lambda_a$ -normal, there exist disjoint  $\Lambda_a$ -open sets  $U$  and  $V$  such that  $f(E) \subset U$  and  $f(F) \subset V$ . Since  $f$  is completely  $\Lambda_a$ -irresolute,  $f^{-1}(U)$  and  $f^{-1}(V)$  are disjoint regular open subsets in  $X$  and hence open subsets in  $X$  such that  $E \subset f^{-1}(U)$ ,  $F \subset f^{-1}(V)$  which shows that  $X$  is normal.

**Theorem 4.16.** Let  $f, g$  be functions. If  $f$  and  $g$  are completely  $\Lambda_a$ -irresolute functions and  $Y$  is a  $\Lambda_a$ - $T_2$  space, then  $P = \{x \in X : f(x) = g(x)\}$  is  $\delta$ -closed.

**Proof.** Let  $x \notin P$ . We have  $f(x) \neq g(x)$ . Since  $Y$  is  $\Lambda_a$ - $T_2$ , there exist disjoint  $\Lambda_a$ -open sets  $A$  and  $B$  in  $Y$  such that  $f(x) \in A$  and  $g(x) \in B$ . Since  $f$  and  $g$  are completely  $\Lambda_a$ -irresolute,  $f^{-1}(A)$  and  $f^{-1}(B)$  are disjoint regular open subsets in  $X$ . Put  $U = f^{-1}(A) \cap f^{-1}(B)$ . Then  $U$  is a regular open subset of  $X$  containing  $x$  and  $U \cap P = \emptyset$  and hence  $x \notin cl_\delta(A)$ . Hence  $P$  is  $\delta$ -closed in  $X$ .
